

An Armchair Guide:

To Quantum Mechanics

Jonathan Allday

Session 7:

Quantum Snake Oil

Bits and pieces

Classical **computing**

Relies on **processing 'bits'**

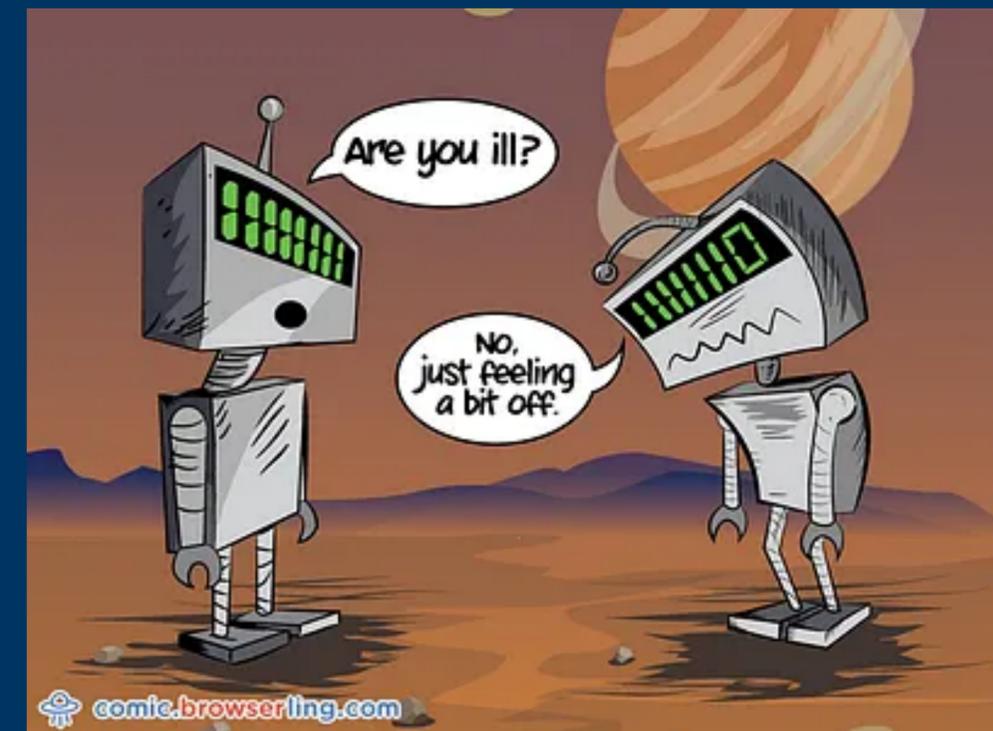

Data **broken** down into 1s and 0s

Each bit has the value 1 or 0 depending on if it is 'set'

Process **multiple bits** (bytes)

Patterns of **voltages**

1 = 5V; 0 = 0V

NAND gate...

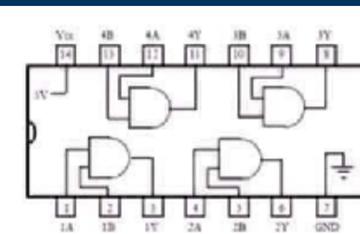

Short for 'not' 'and'

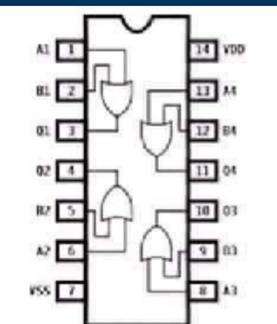

Not an obvious 'gate'

But the easiest to build

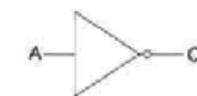

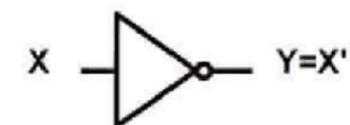

Backbone of all other possibilities...

AND Gates

OR Gates

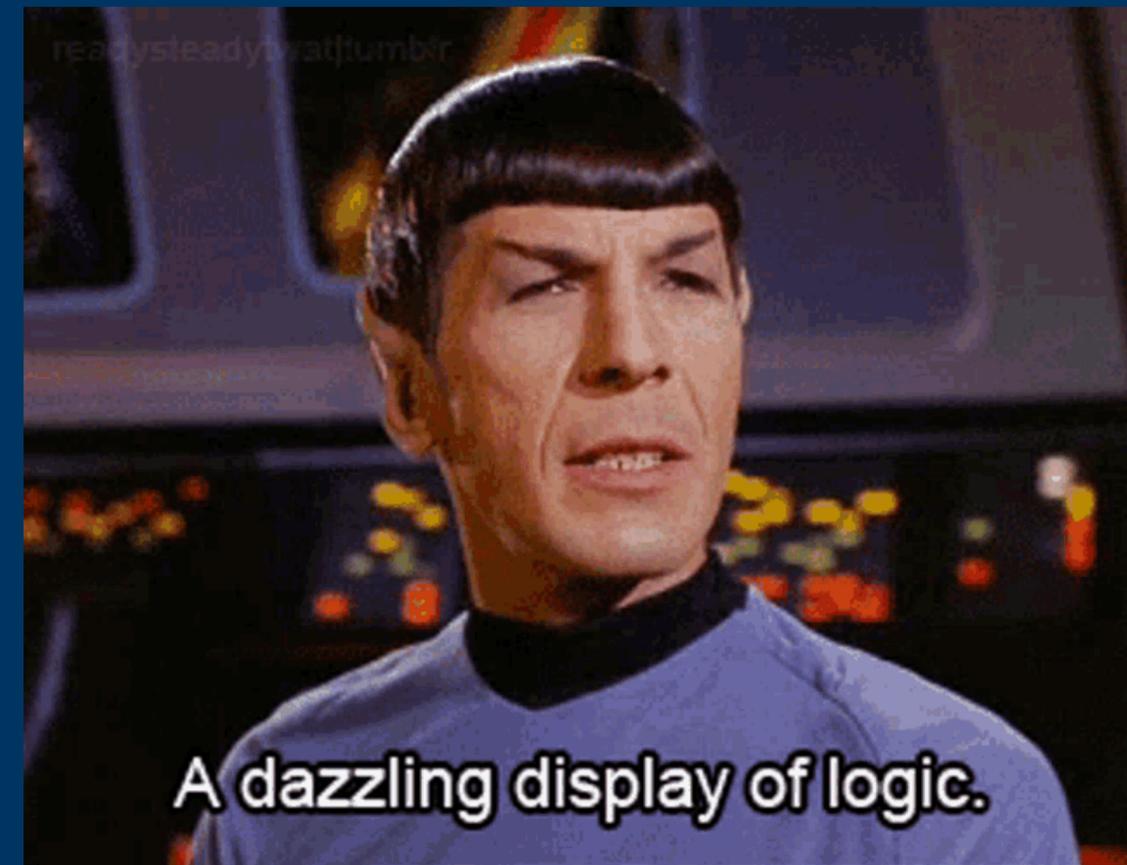

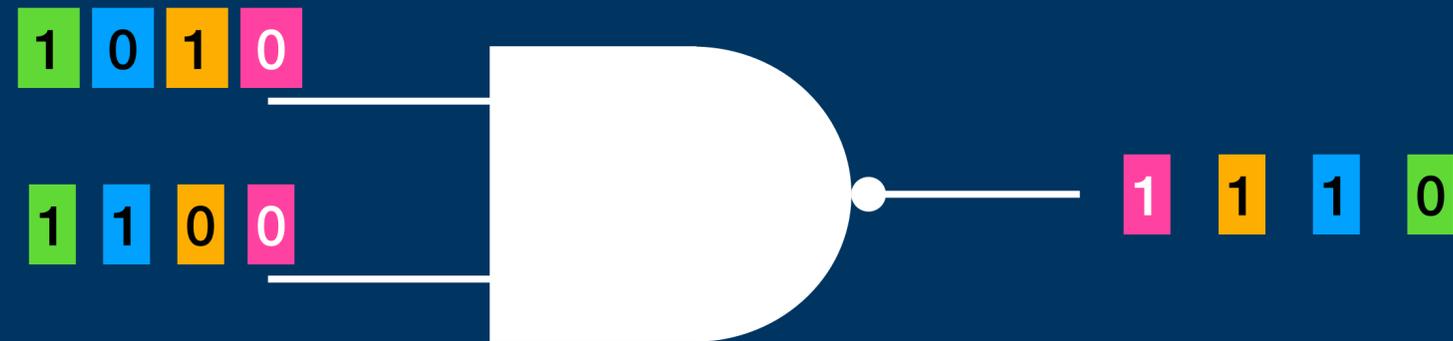

NOT Gates

Bill Gates

NAND gate...

NAND gate...

Truth Table

Input		Output
A	B	Q
0	0	1
1	0	1
0	1	1
1	1	0

Marriage gate...

www.TechnicallyFunny.com

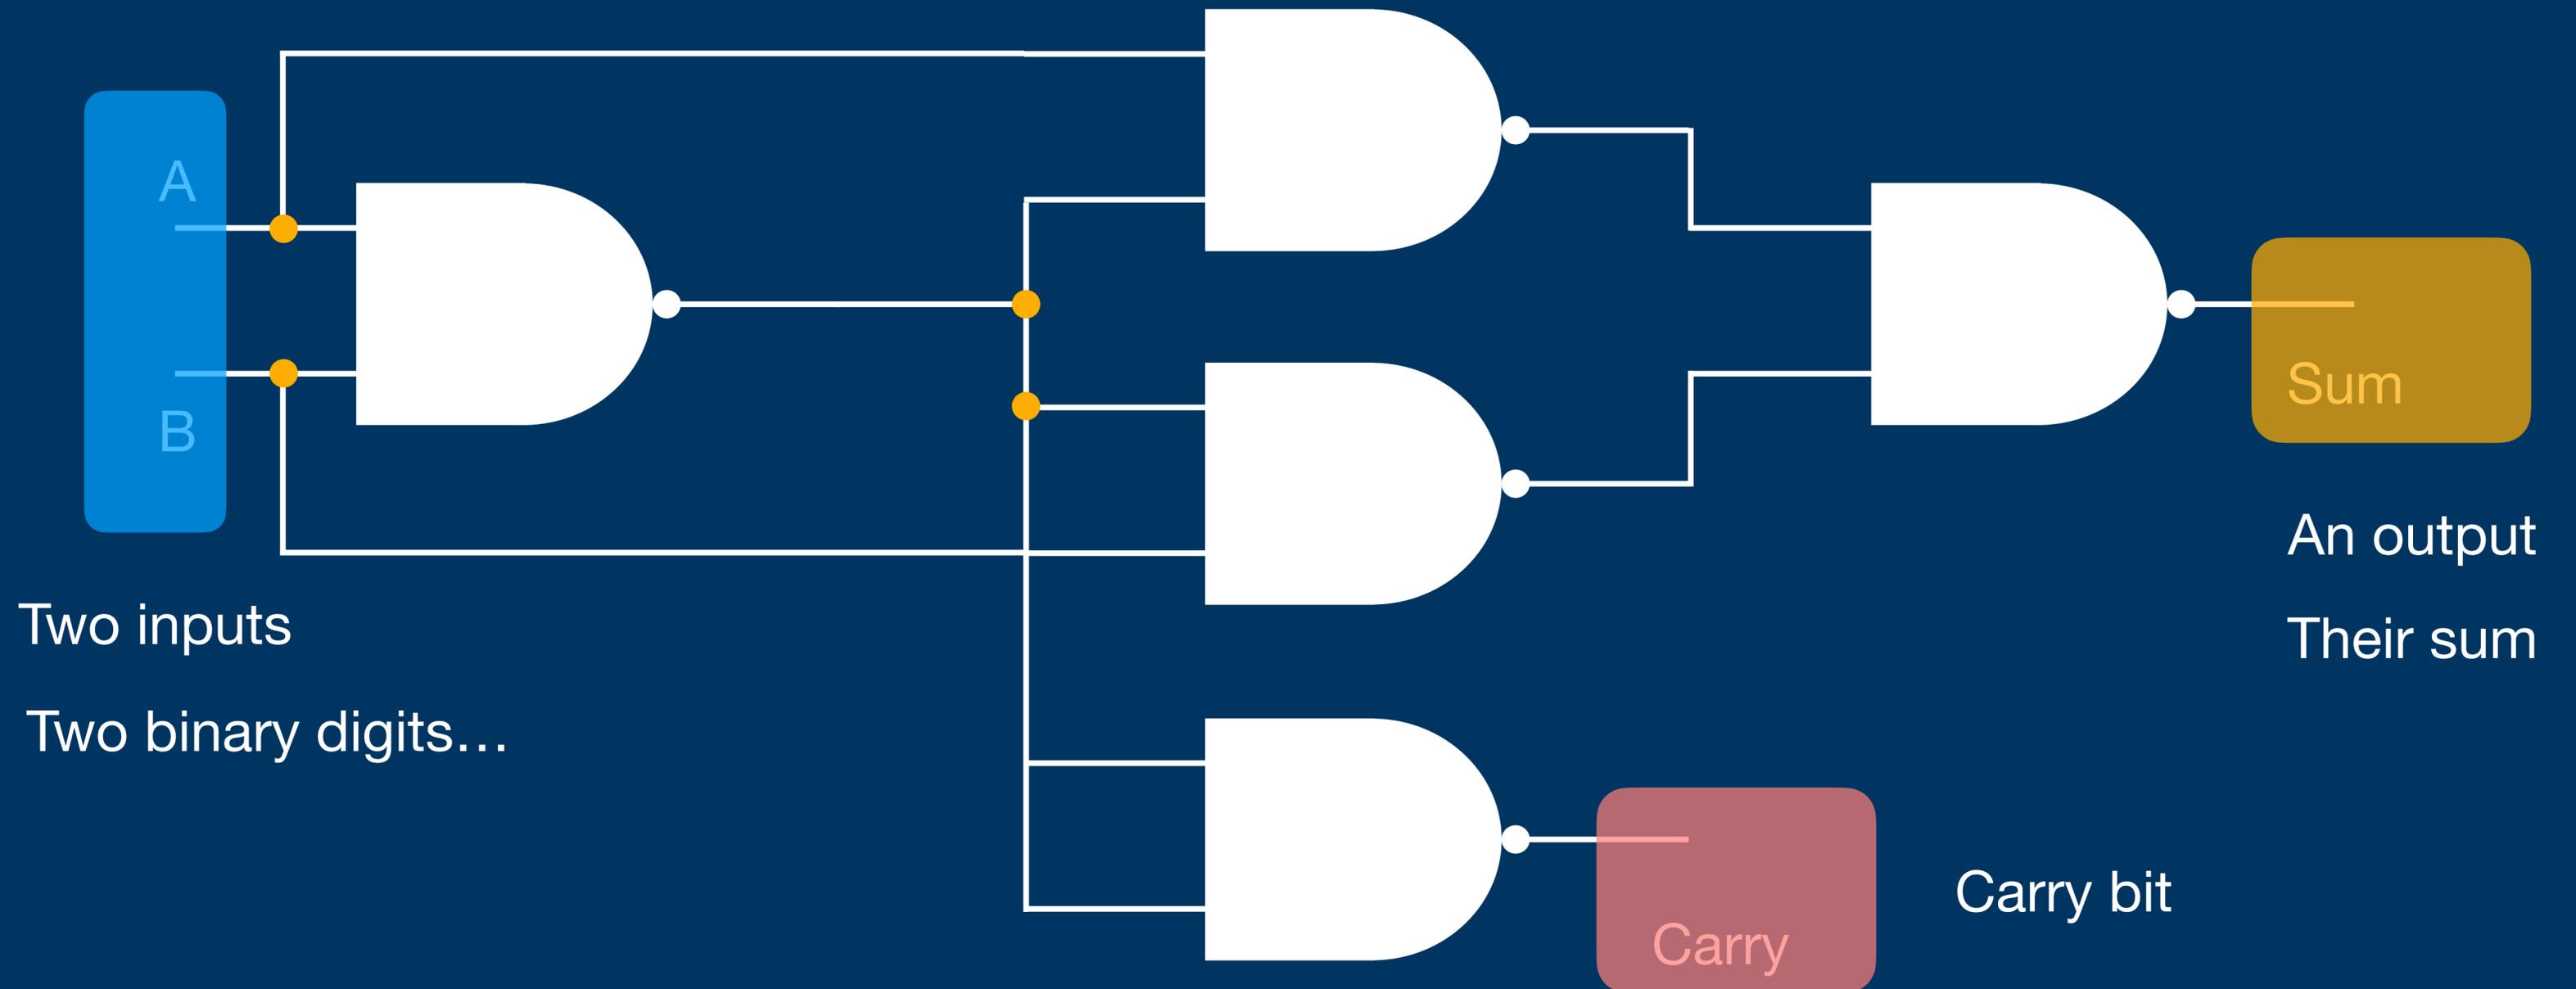

AND Gate

A — Output
B —

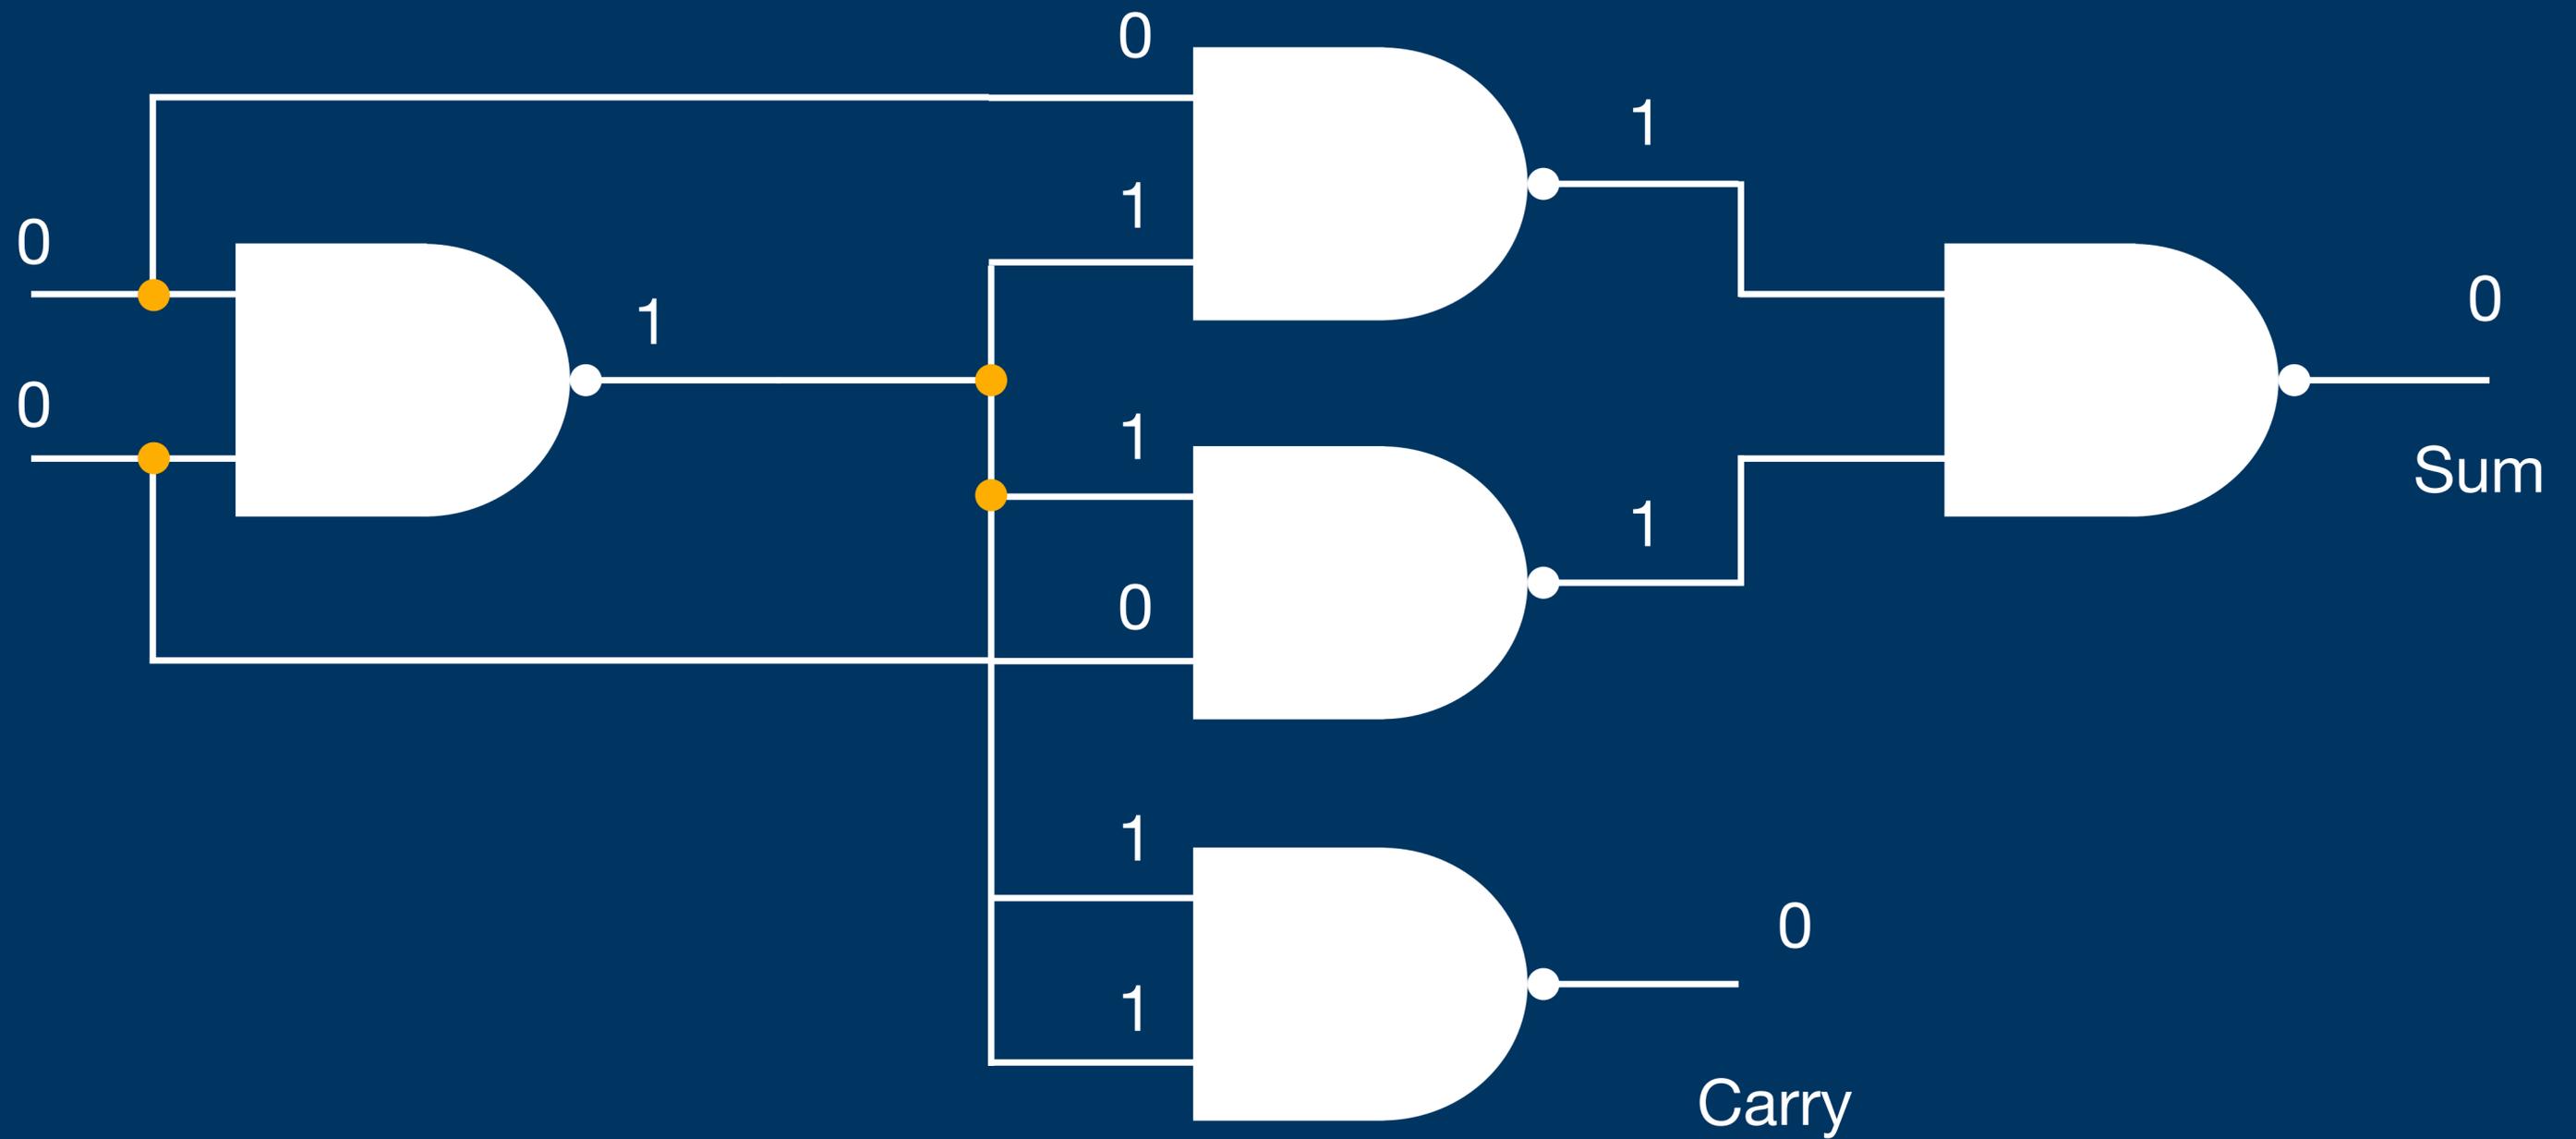

Logic Map

	A	B	A AND B

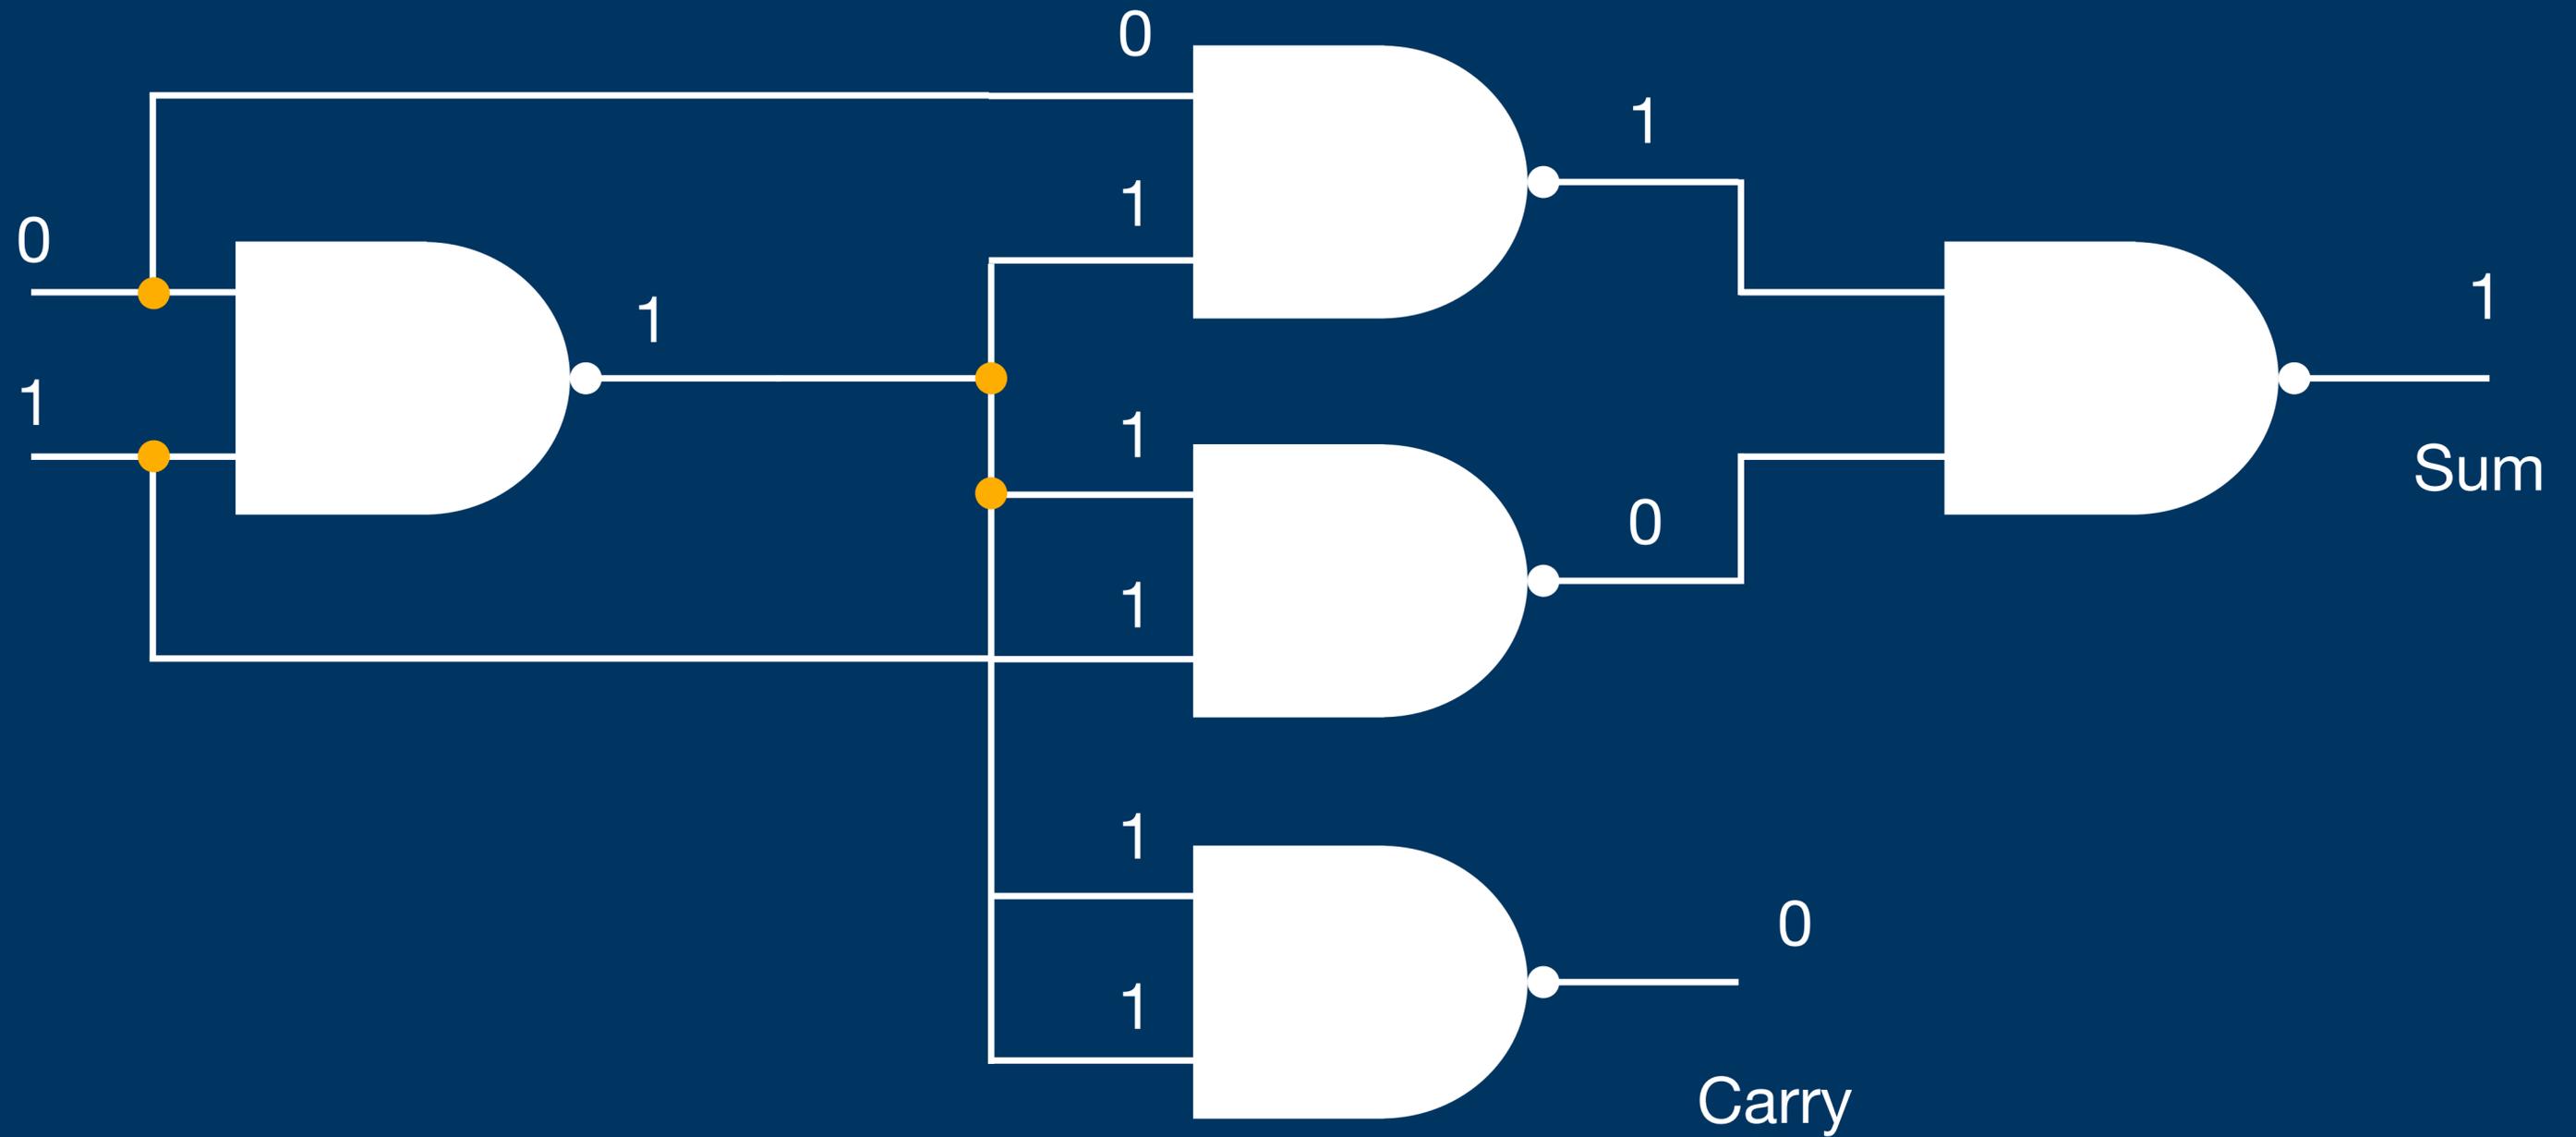

Half adder...

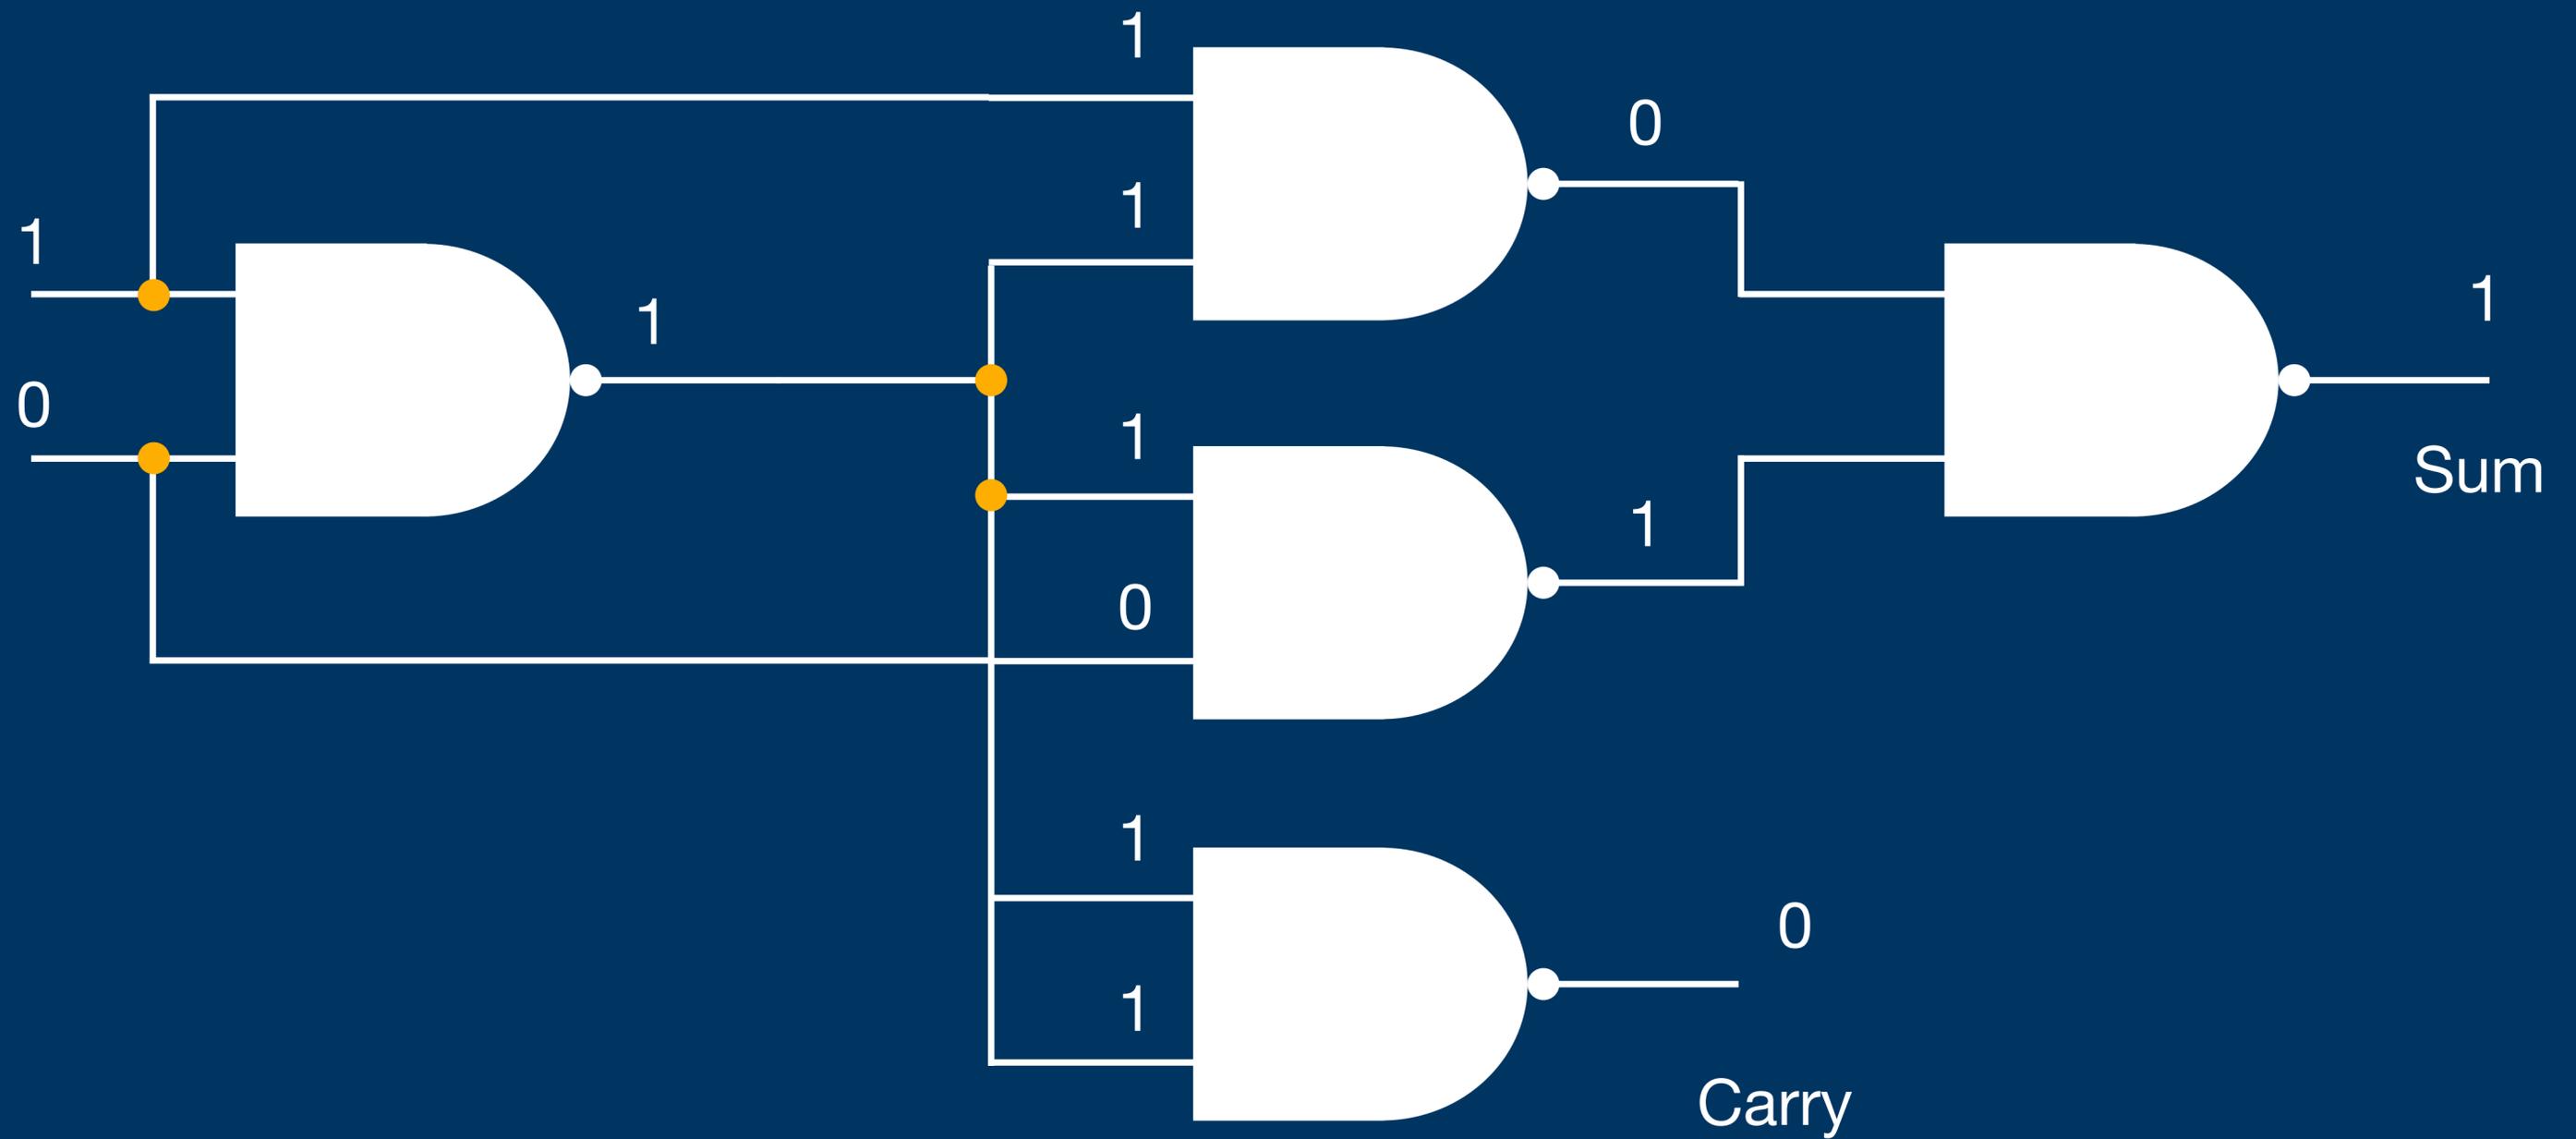

Half adder...

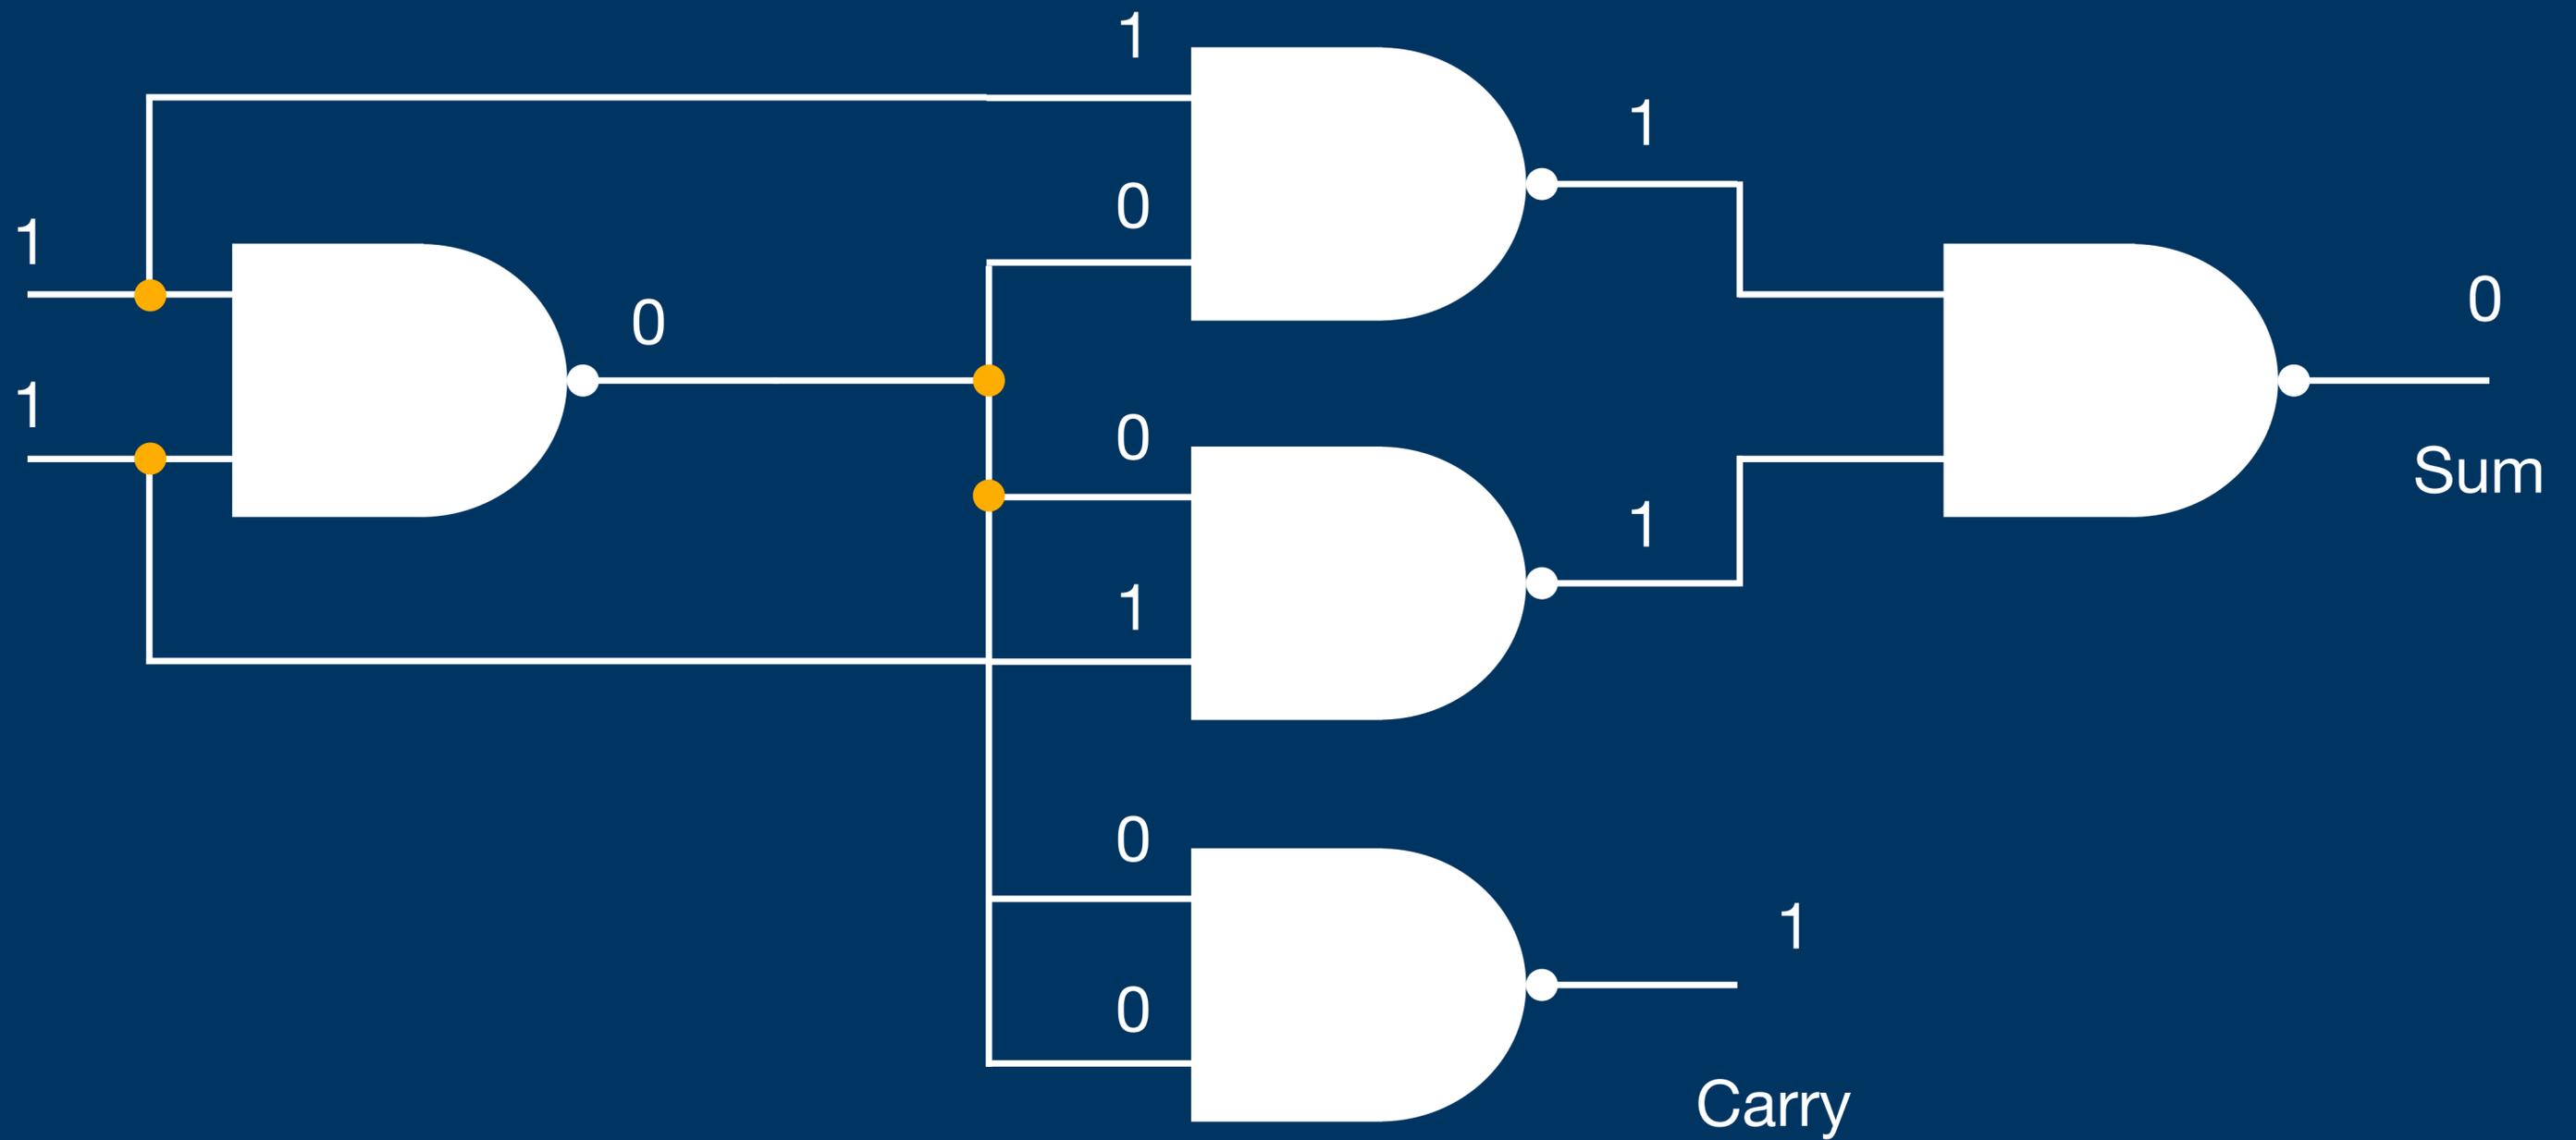

Half adder...

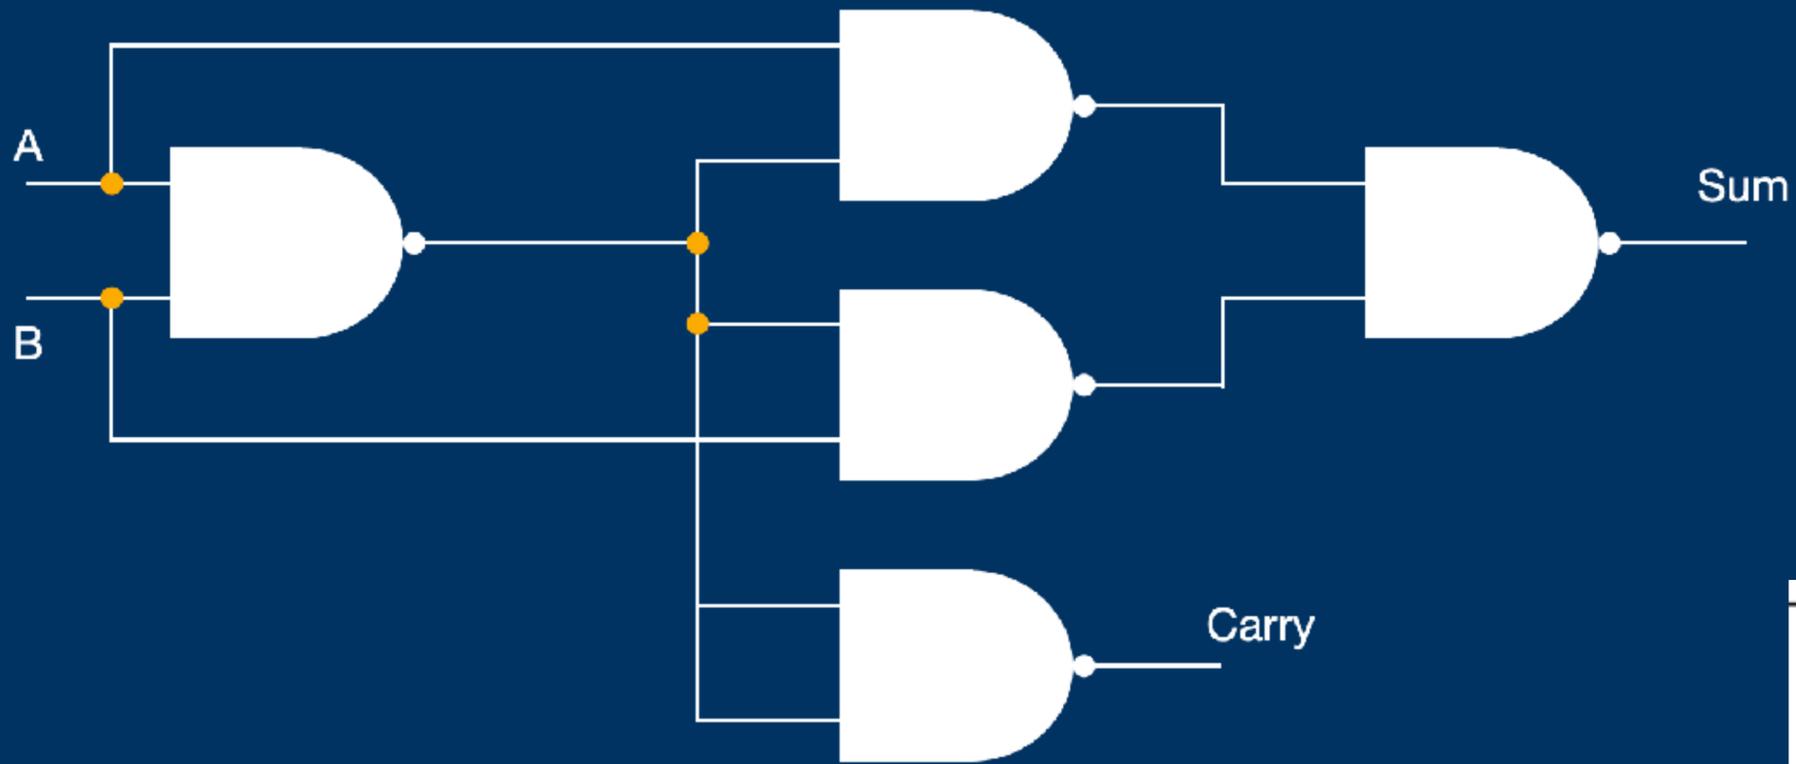

Half adder...

Half adder...

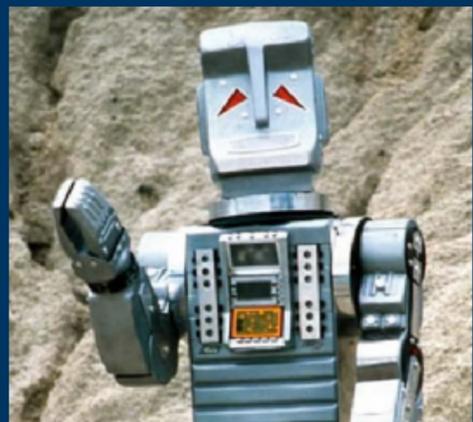

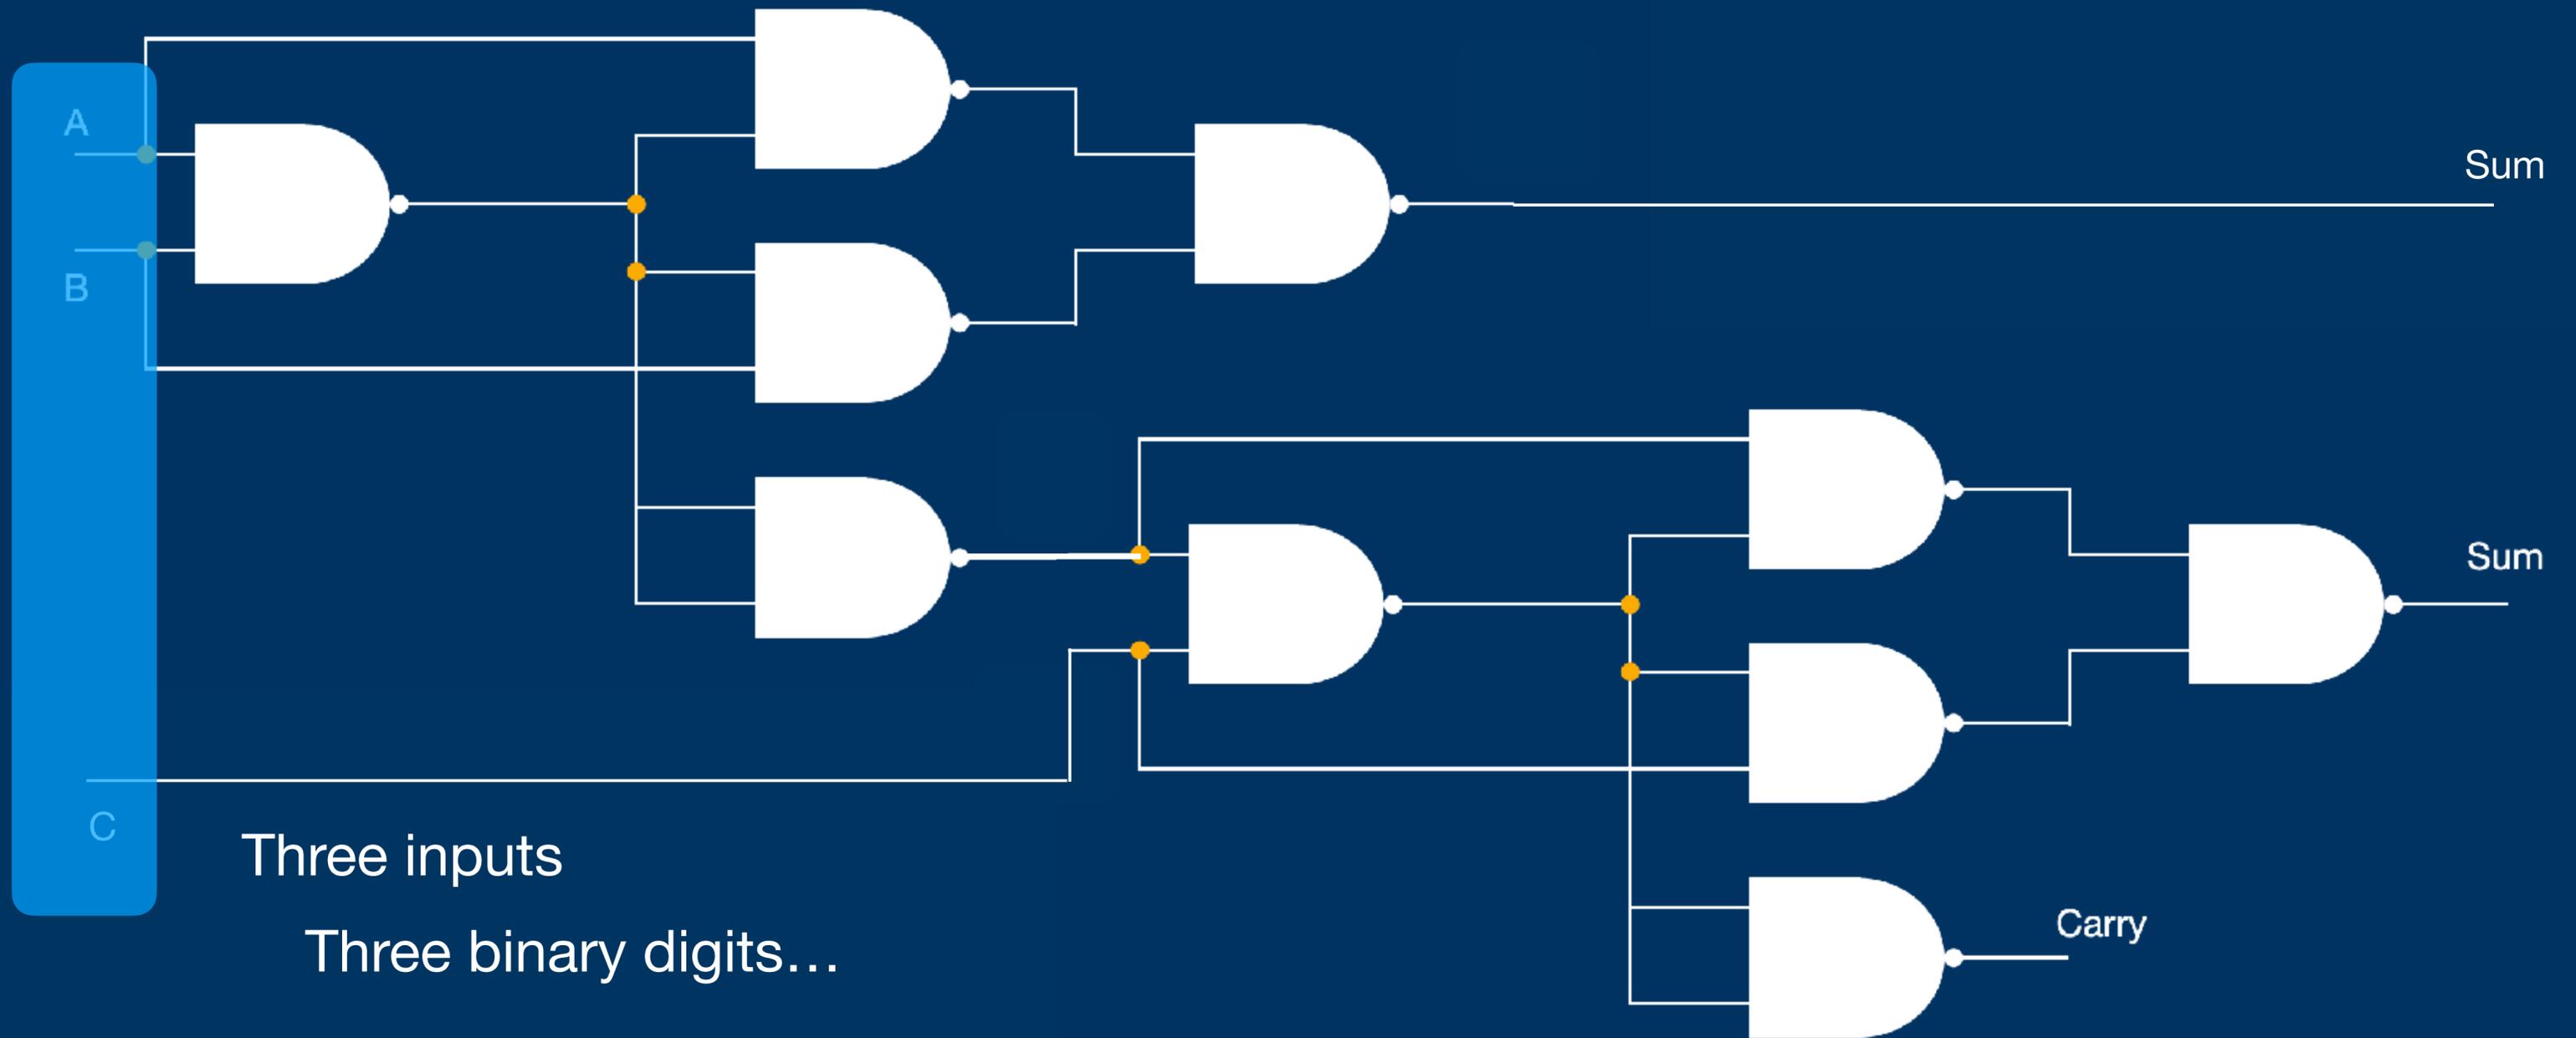

Adding the two bits together

The carry goes to the next adder...

Input		Output	
A	B	Sum	Carry
0	0	0	0
0	1	1	0
1	0	1	0
1	1	0	1

I've got this terrible pain in all the diodes down my left side...

Marvin - the paranoid android

Full adder....?

Moore's law...

No of transistors per chip

Doubles every **2 years**

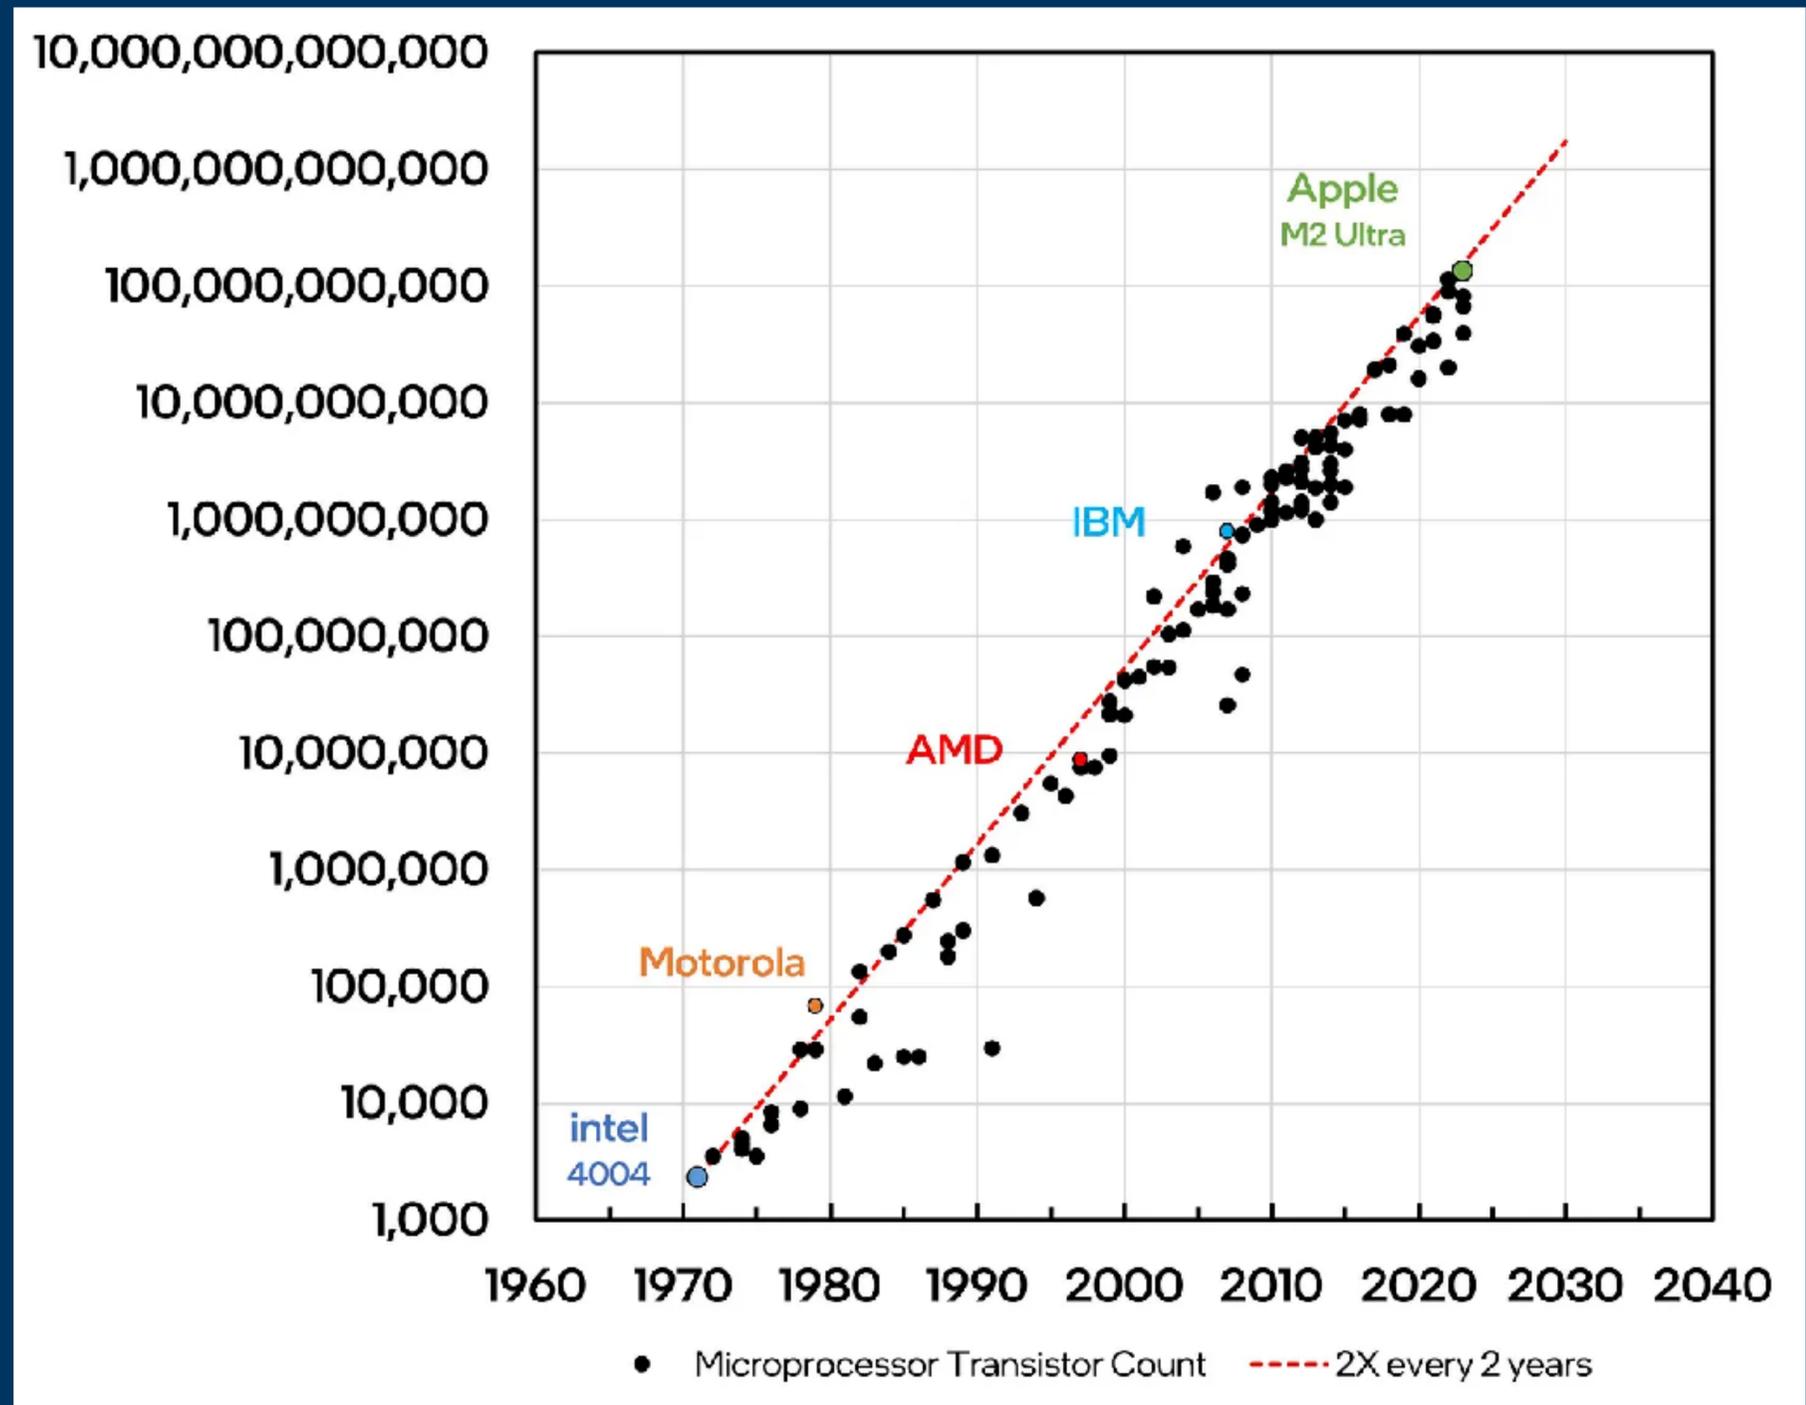

Hence **size** of a **transistor**

Heading **downwards**...

1971 ~ 10 μm

2020 ~ 5 nm

—> **atomic** scale...

Qubits

Analogy with a computer bit

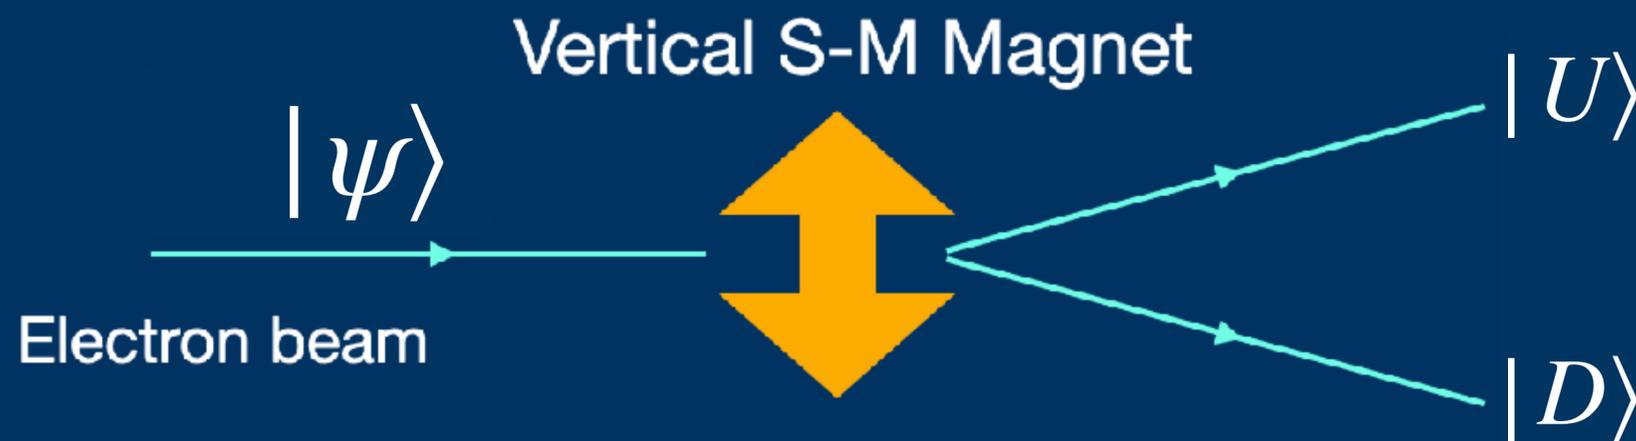

A quantum system with two states...

BIT: HEADS OR TAILS

QUBIT: HEADS AND TAILS

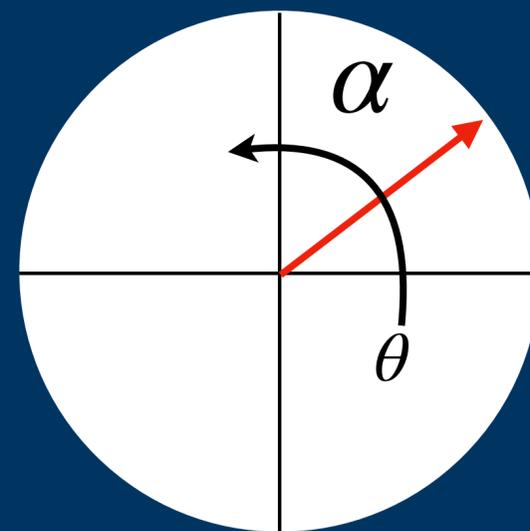

$$|\psi\rangle = A|U\rangle + B|D\rangle$$

1

0

The equation shows the superposition of the two states. The term $|U\rangle$ is highlighted in a yellow box and has an arrow pointing to the number 1. The term $|D\rangle$ is highlighted in a blue box and has an arrow pointing to the number 0.

Qubits

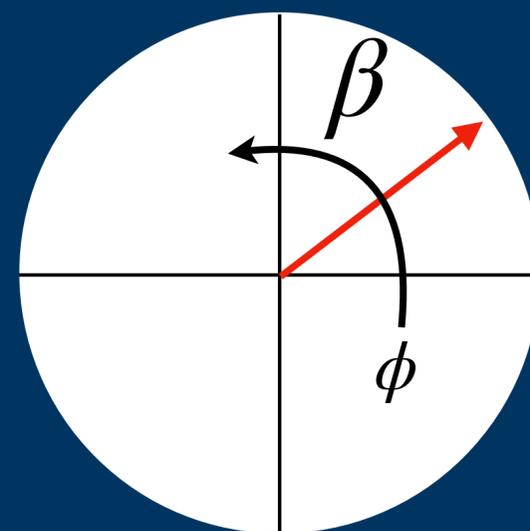

$$A = \alpha e^{i\theta/\hbar}$$

$$|\psi\rangle = A |U\rangle + B |D\rangle$$

1

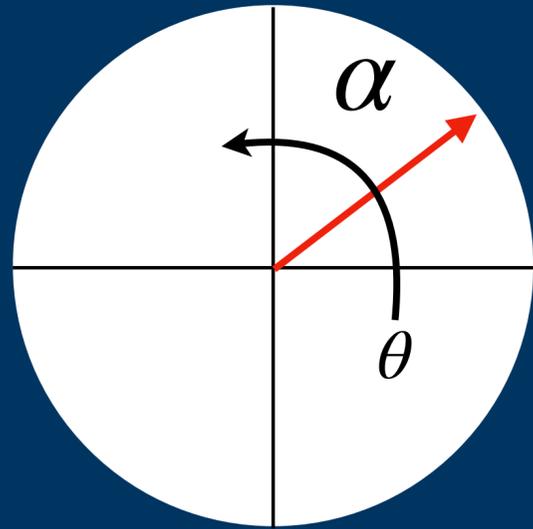

0

The equation shows the state $|\psi\rangle$ as a superposition of $|U\rangle$ and $|D\rangle$. The $|U\rangle$ term is highlighted in a yellow box and has an arrow pointing to the number 1. The $|D\rangle$ term is highlighted in a blue box and has an arrow pointing to the number 0.

$$B = \beta e^{i\phi/\hbar}$$

Qubits

$$A = \alpha e^{i\theta/\hbar}$$

Might think we have 4 numbers to play with...

α and β being two of them...

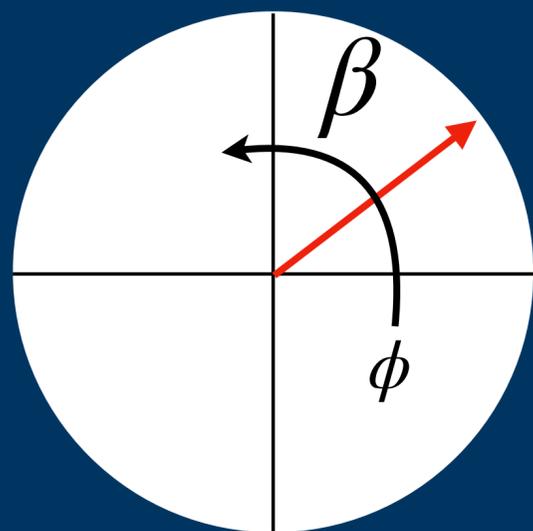

θ and ϕ being two more...

But...

$$\alpha + \beta = 1$$

Only phase difference matters...

$$\gamma = \phi - \theta$$

$$B = \beta e^{i\phi/\hbar}$$

Information dense...

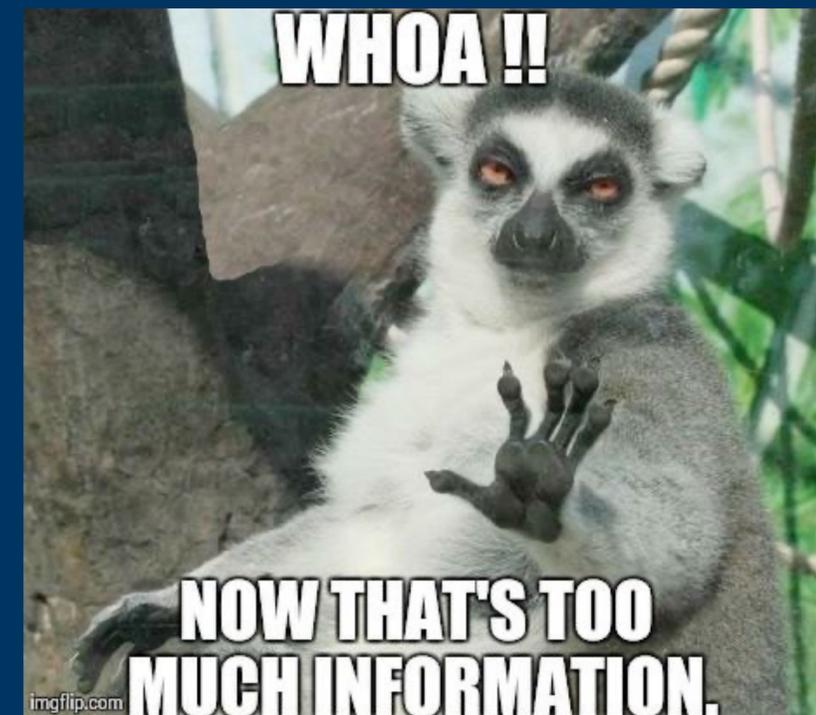

Our qubit is...

$$|\psi\rangle = \alpha |1\rangle + (1 - \alpha)e^{i\gamma} |0\rangle$$

However, it can **contain** a **lot of data**

n bits of data can go into γ by **specifying** the **angle** to n bits....

n bits of data can go into α by **specifying** the **length** to n bits....

Result poor

$$|\psi\rangle = \alpha |1\rangle + (1 - \alpha)e^{i\gamma} |0\rangle$$

How do you get the information out?

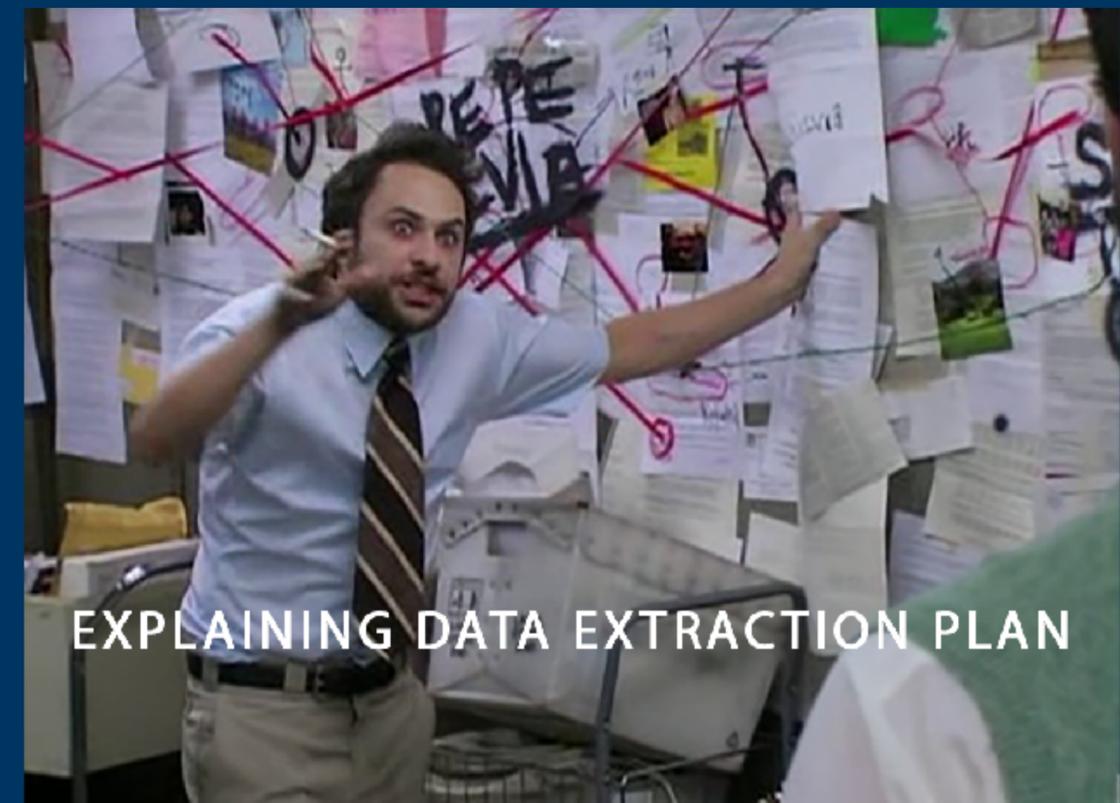

Imagine our qbit is the result of a calculation

Need to get values for α and γ

Measurement only yields

1 0

State collapses...

The needs of the many...

$$|\psi\rangle = \alpha|1\rangle + (1 - \alpha)e^{i\gamma}|0\rangle$$

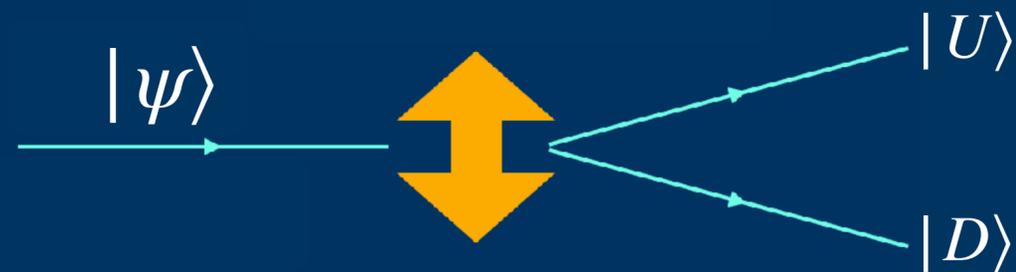

A collection of identical qubits...

Measure using a vertical SG

Make N measurements

$$\alpha^2 \approx \frac{\text{no of times we get } |1\rangle}{N}$$

$$\text{Estimation precision} \sim \frac{1}{\sqrt{N}}$$

The needs of the many...

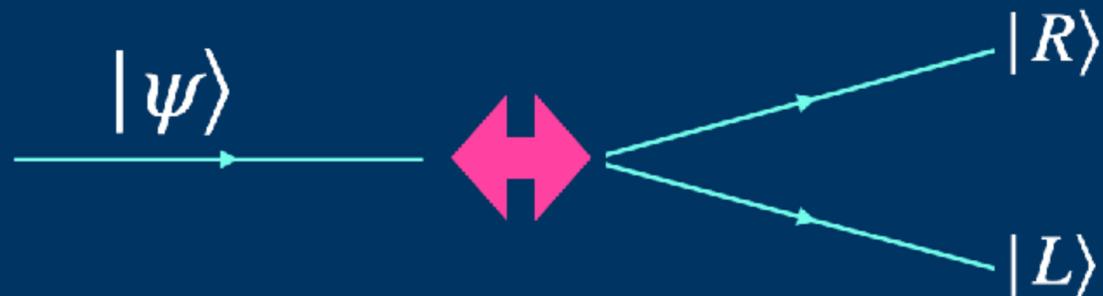

$$|\psi\rangle = \alpha|1\rangle + (1 - \alpha)e^{i\gamma}|0\rangle$$

A collection of **identical qubits**...

Measure using a **horizontal SG**

Make N measurements

Having already **got** α you can **extract** γ

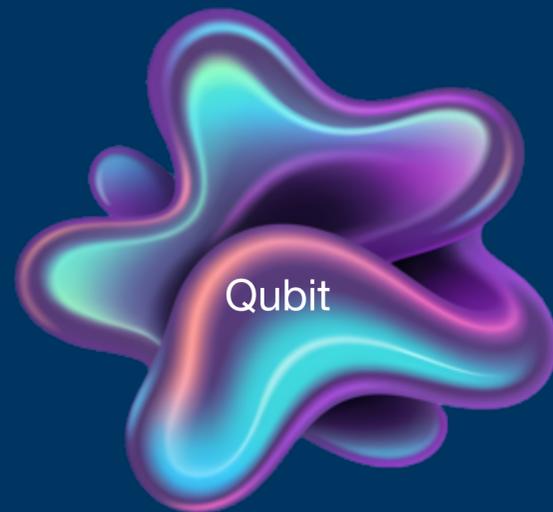

Quantum computation

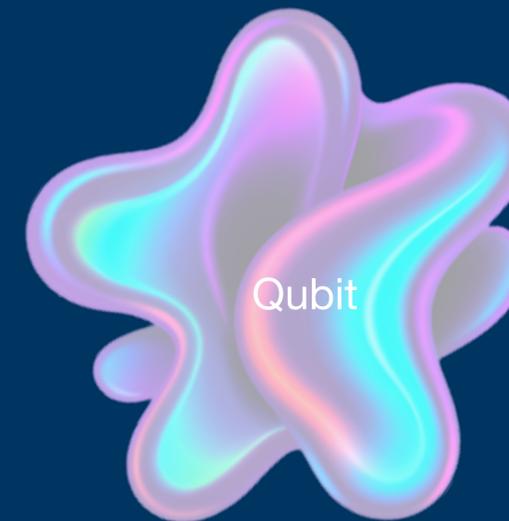

Prepare a qubit according to a repeatable process

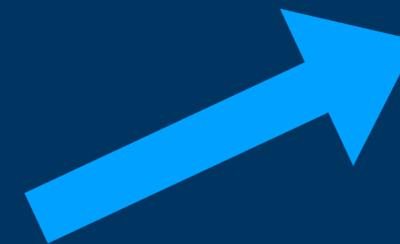

$|\psi\rangle$

Force it to evolve

Measure to get 1 classical bit

This is your calculation....

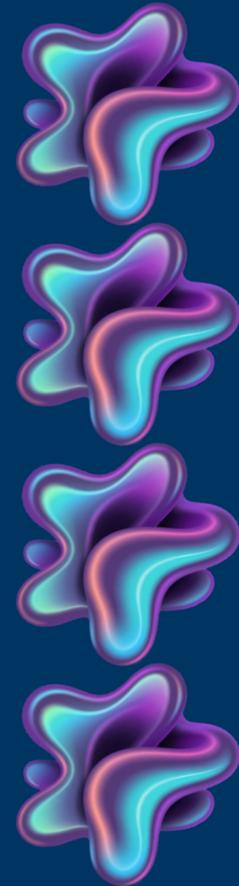

~ 1000 times per second...

Better...

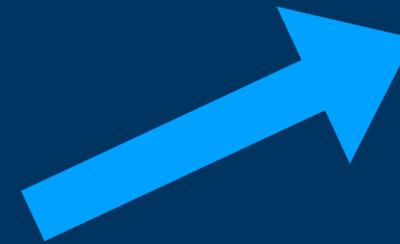

N entangled qubits

Forced to evolve

Measure to get N classical bits

Reset and repeat...

Best of the best (ish)

IBM Condor

1121 qubits

Superconducting atomic junctions

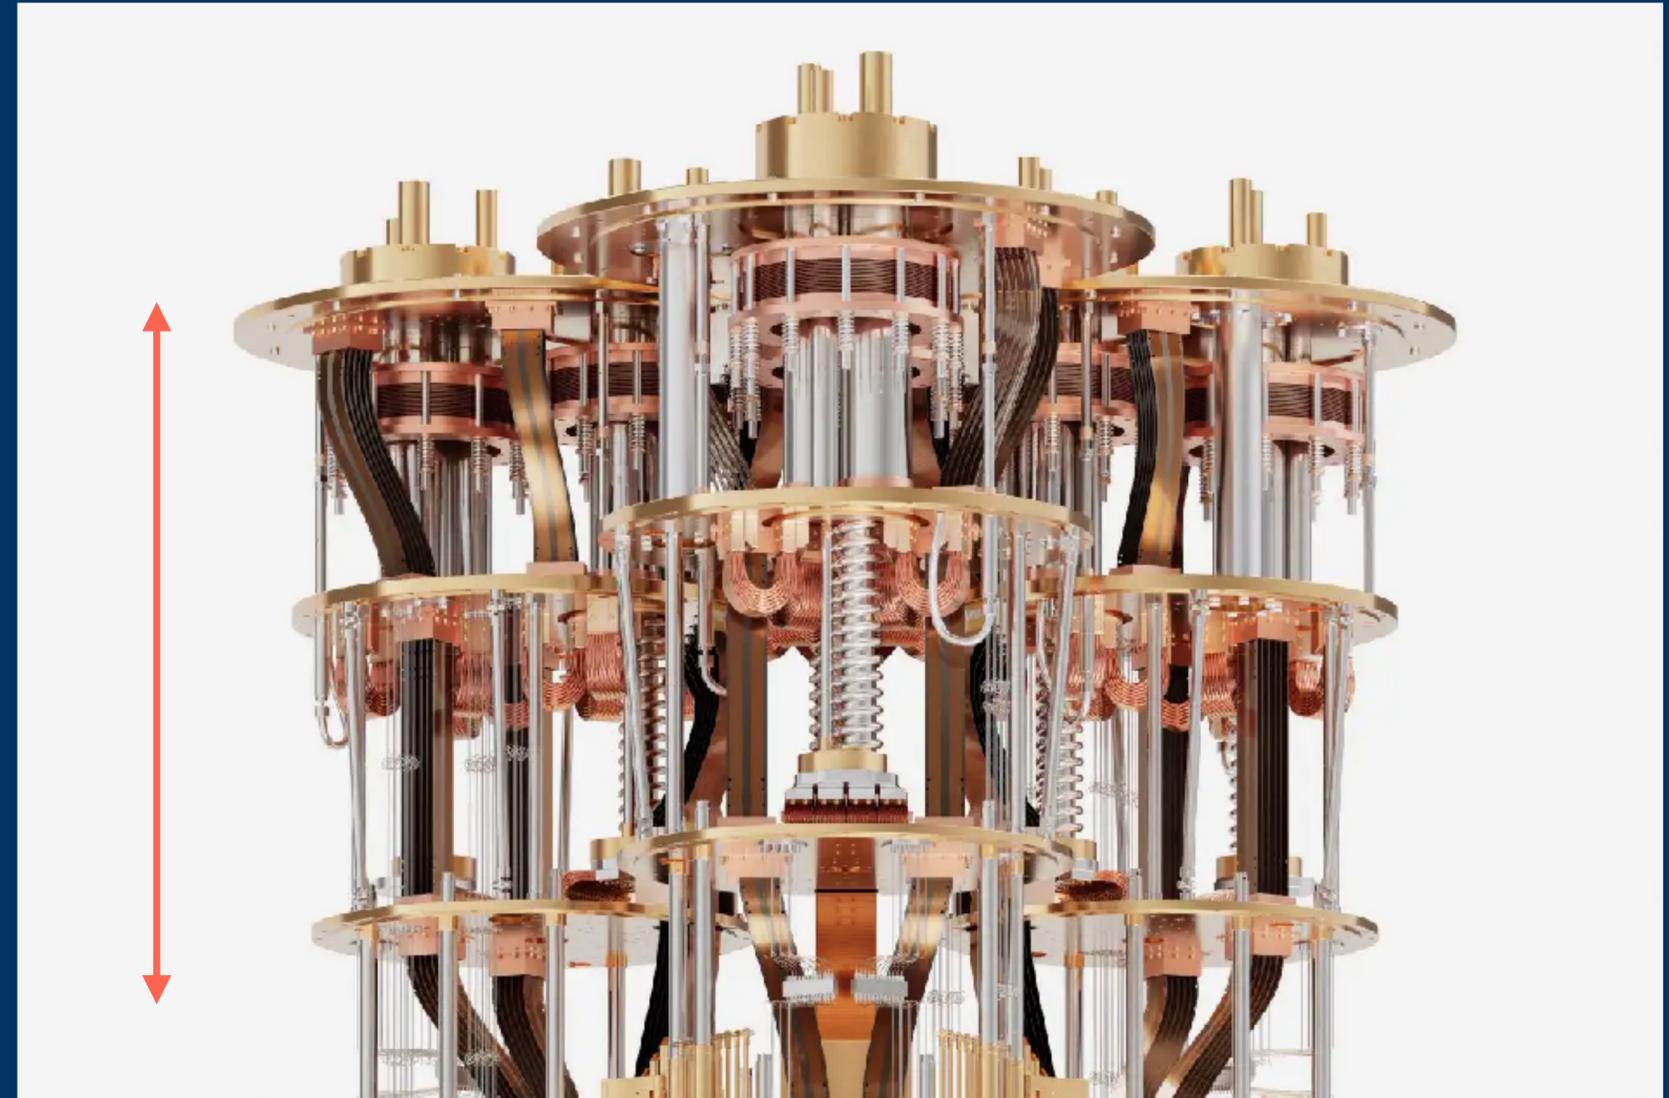

Two lowest energy states of the junction

Quantum gates:

Microwave pulses applied to the qubits

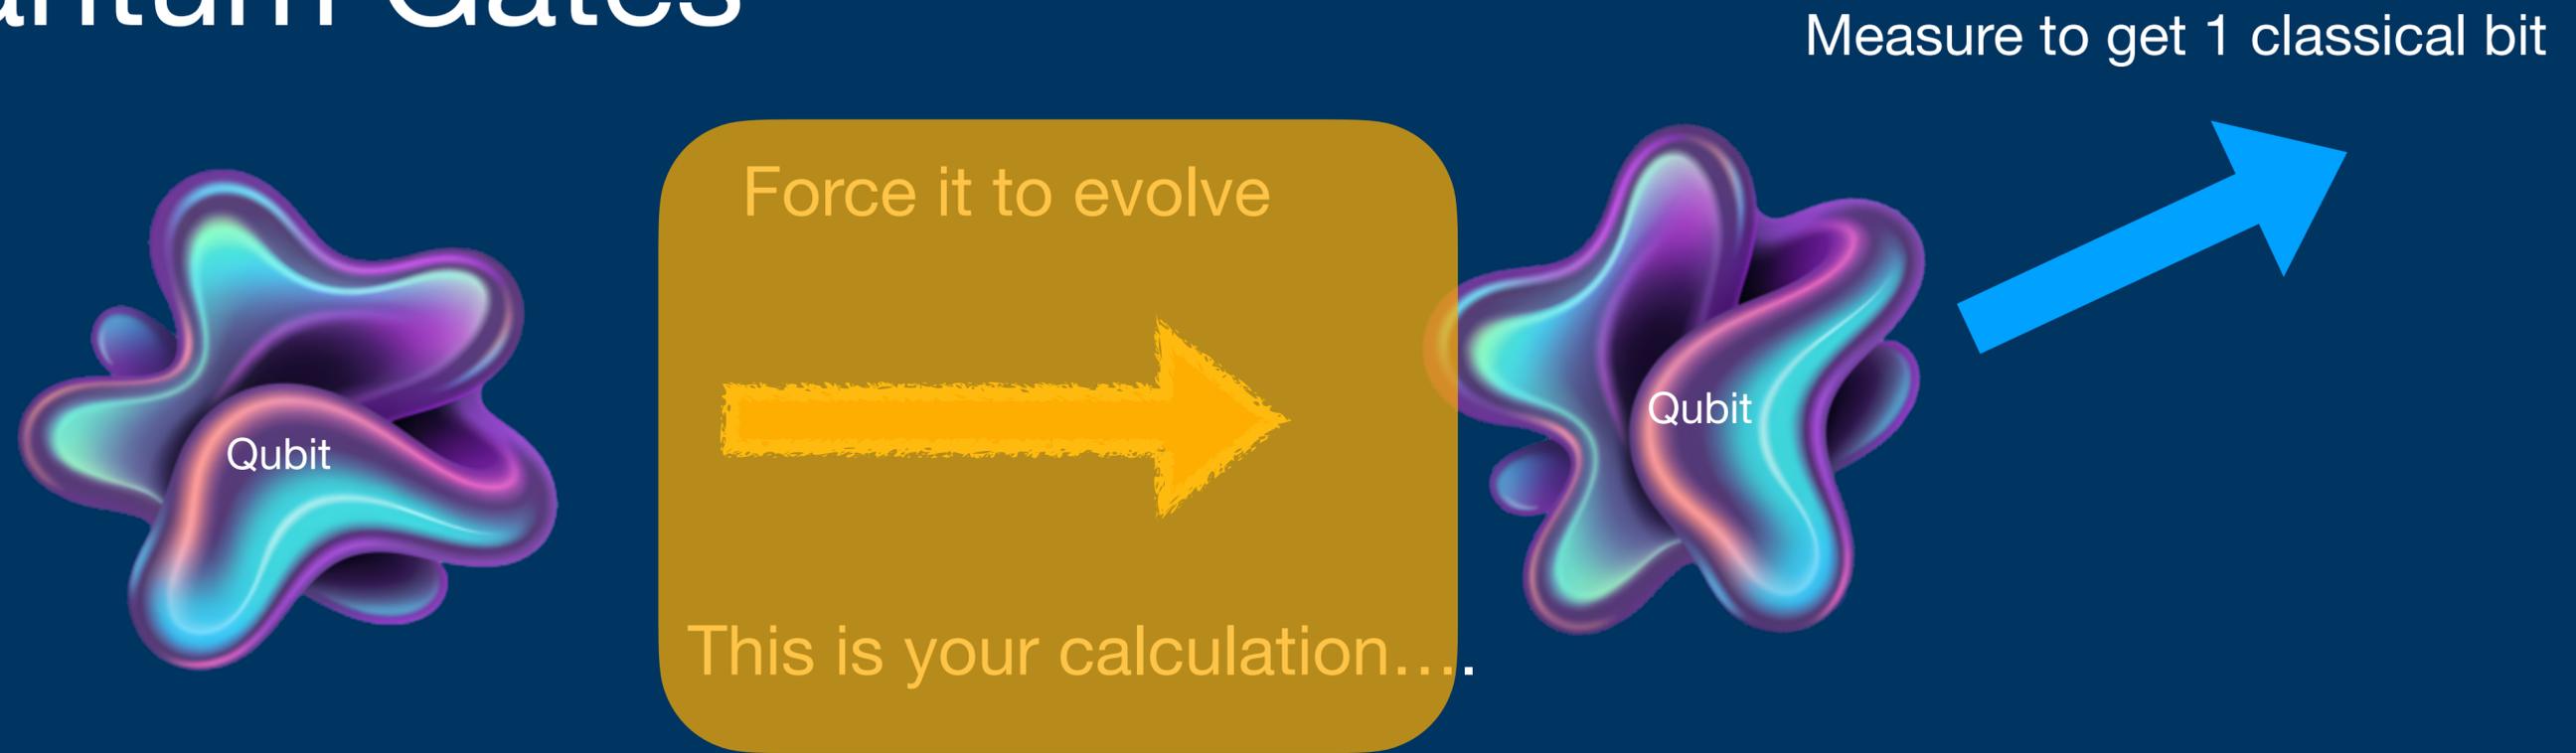

Specific frequencies, phases, shapes and timing

12 ft

22 ft

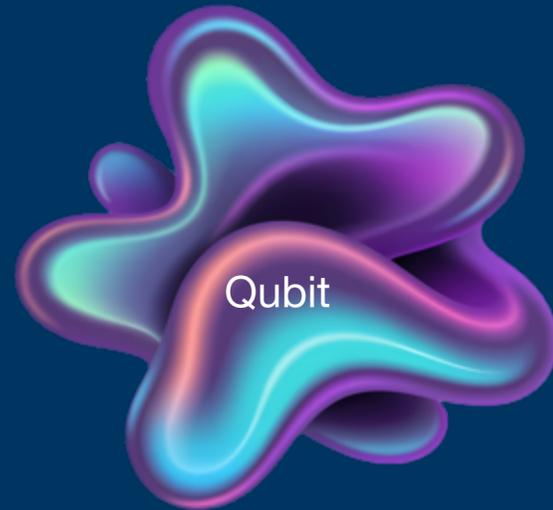

Quantum Gates

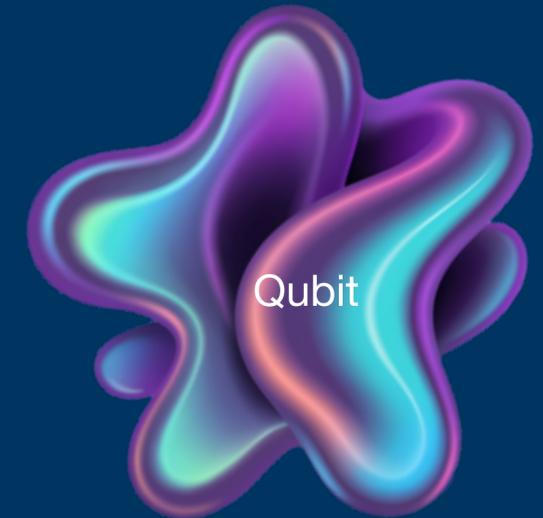

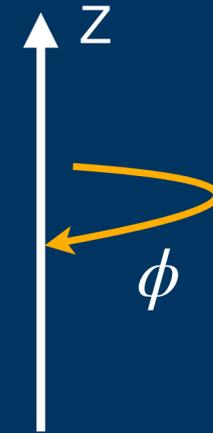

Needs to be 'programmable'

Break it down into a set of 'gates'

Quantum Gates

$$\psi = \alpha |1\rangle + \beta e^{i\gamma} |0\rangle$$

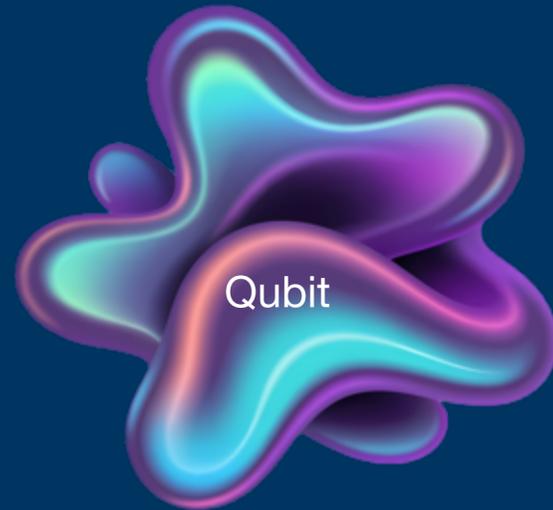

$$\psi = \alpha e^{i\phi/2} |1\rangle + \beta e^{i\gamma} e^{-i\phi/2} |0\rangle$$

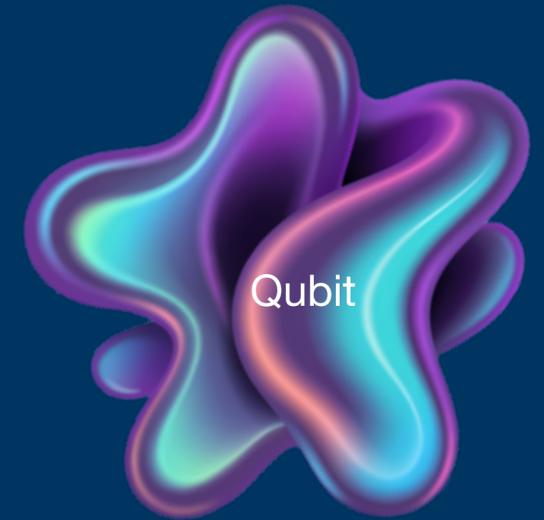

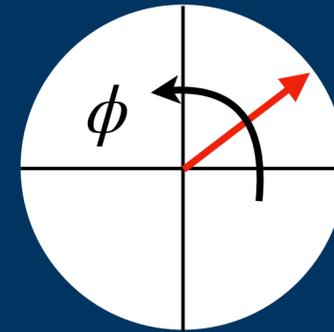

X, Y, Z gates

Rotate the state about the axes

Quantum Gates

$$\psi = \alpha |1\rangle + \beta e^{i\gamma} |0\rangle$$

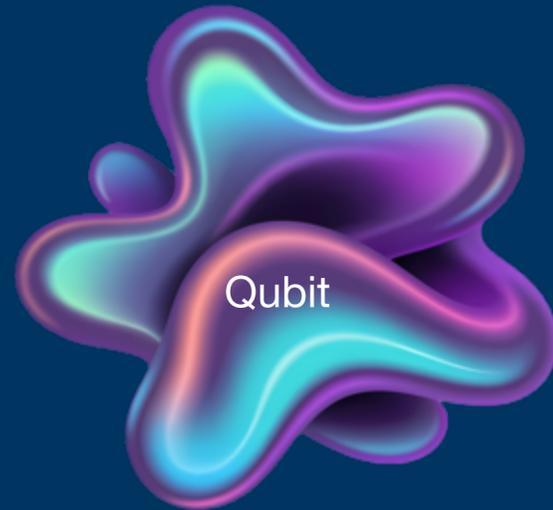

$$\psi = \alpha e^{i\phi} |1\rangle + \beta e^{i\gamma} |0\rangle$$

Phase gate

Inserts a relative phase into the qubit

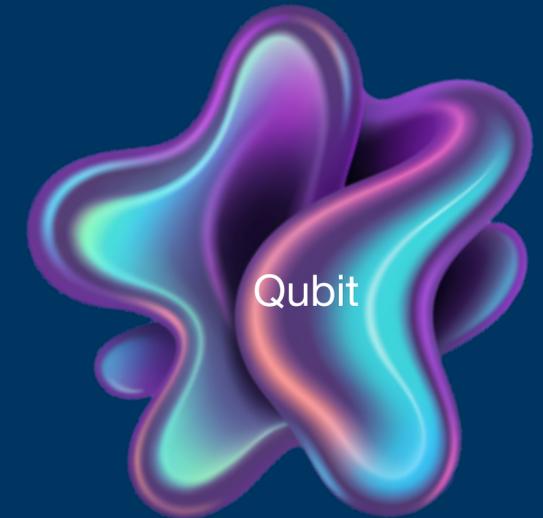

Quantum Gates

$$\psi = \alpha |1\rangle + \beta e^{i\gamma} |0\rangle$$

$$H = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$$

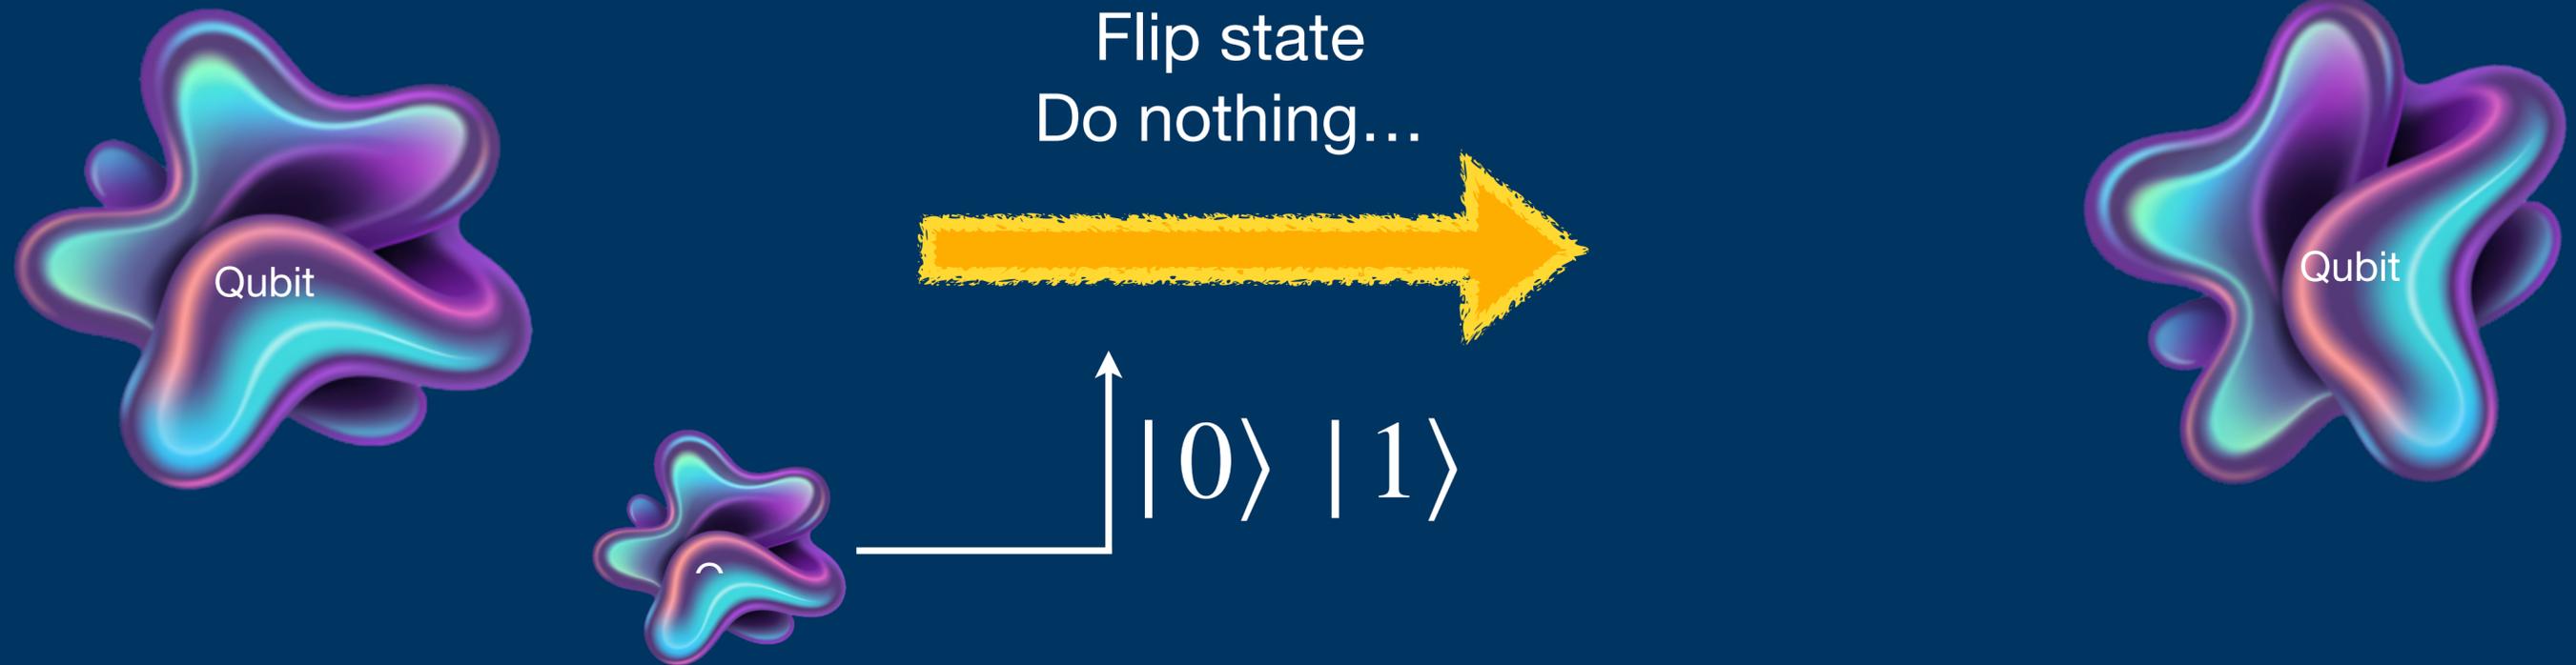

$$\psi = \frac{1}{\sqrt{2}} [(\beta e^{i\gamma} - \alpha) |1\rangle + (\beta e^{i\gamma} + \alpha) |0\rangle]$$

Hadamard gate

Kind of generally fiddles with things....

Quantum Gates

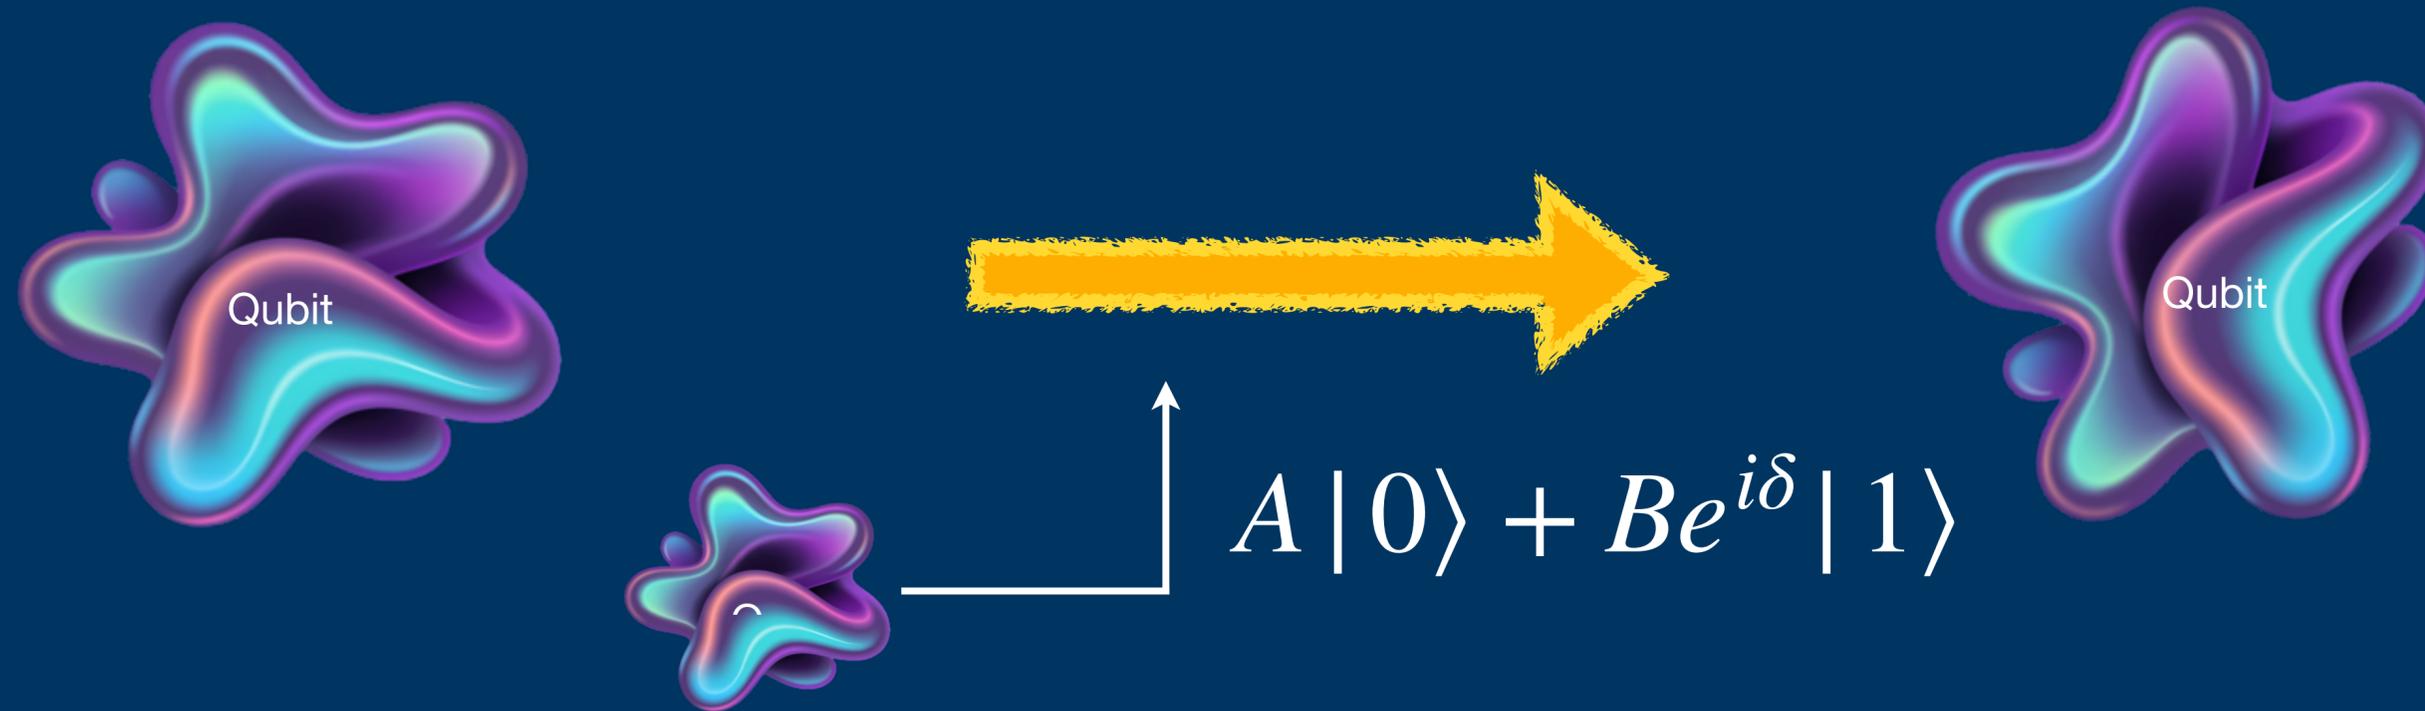

$$\begin{aligned} \Psi &= \alpha |0\rangle |1\rangle + \beta e^{i\gamma} |0\rangle |0\rangle \\ \Psi &= \alpha |1\rangle |1\rangle + \beta e^{i\gamma} |1\rangle |0\rangle \end{aligned} \quad \longrightarrow \quad \begin{aligned} \Psi &= \alpha |0\rangle |1\rangle + \beta e^{i\gamma} |0\rangle |0\rangle \\ \Psi &= \alpha |1\rangle |0\rangle + \beta e^{i\gamma} |1\rangle |1\rangle \end{aligned}$$

CNOT gate

Acts on one qubit according to the state of another

Quantum Gates

If control qubit is in a superposition...

CNOT entangles the qubits...

$$A\alpha|0\rangle|1\rangle + \beta e^{i\delta}|0\rangle|1\rangle + A\beta e^{i\delta}|1\rangle|1\rangle + \beta B e^{i(\delta+\gamma)}|1\rangle|0\rangle$$

So...

New state

Measure to get N
classical bits

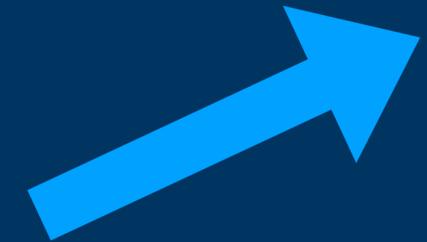

Sequence of gates

This forms our 'programme'

Or algorithm

N entangled qubits

N entangled qubits

Example...

Evaluate a statement:

a AND NOT b

Conventionally, evaluate a row at a time...

a	b	NOT b	a AND NOT b
F	F	T	F
T	F	T	T
F	T	F	F
T	T	F	T

Quantum Computer

$$F = |0\rangle \quad T = |1\rangle$$

One qubit for each variable

Set to F

$$|\dots \phi \dots\rangle |0\rangle |0\rangle \dots |0\rangle |0\rangle$$

One qubit for the result

Another sequence is the query being evaluated

a	b	NOT b	a AND NOT b
F	F	T	F
T	F	T	T
F	T	F	F
T	T	F	T

Quantum Computer

Apply Hadamard gate to first qubit...

$$|\dots \phi \dots\rangle |0\rangle |0\rangle \dots |0\rangle$$

$$|\dots \phi \dots\rangle \frac{1}{\sqrt{2}} [|1\rangle + |0\rangle] |0\rangle \dots |0\rangle |0\rangle$$

Apply to each qubit in turn

until the sequence is an entanglement of each qubit in a superposition of T/F

a	b	NOT b	a AND NOT b
F	F	T	F
T	F	T	T
F	T	F	F
T	T	F	T

Quantum Computer

$|\dots\phi\dots\rangle |1/0\rangle |1/0\rangle \dots |1/0\rangle |0\rangle$

a	b	NOT b	a AND NOT b
F	F	T	F
T	F	T	T
F	T	F	F
T	T	F	T

Then run the 'code' that evaluates all possibilities in one go...

Cool....

Becomes an entanglement of all the row answers...

But... how do you get the answer out?

Any measurement collapses the entanglement

Just gives the answer for one row...

Rinse and repeat...

No better than conventional...

Scott Aaronson

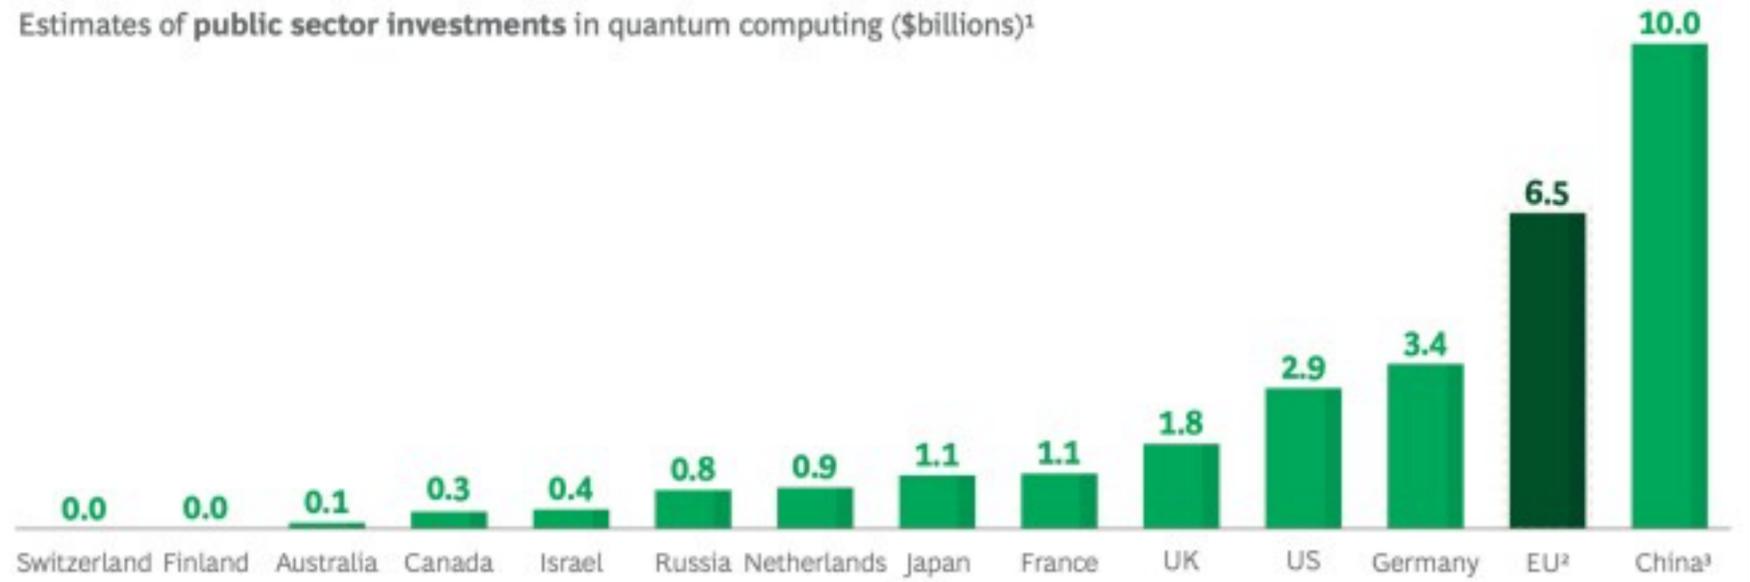

If you take nothing else from this blog: quantum computers won't solve hard problems instantly by just trying all solutions in parallel.

The **goal** in **devising** an **algorithm** for a **quantum computer** is to **choreograph** a pattern of **constructive and destructive interference** so that for **each wrong answer** the **contributions to its amplitude cancel each other out**, whereas for the **right answer** the **contributions reinforce each other**. If, and only if, **you can arrange that**, you'll see the right answer with a large probability when you look.

How do we do that?

Estimates of public sector investments in quantum computing (\$billions)¹

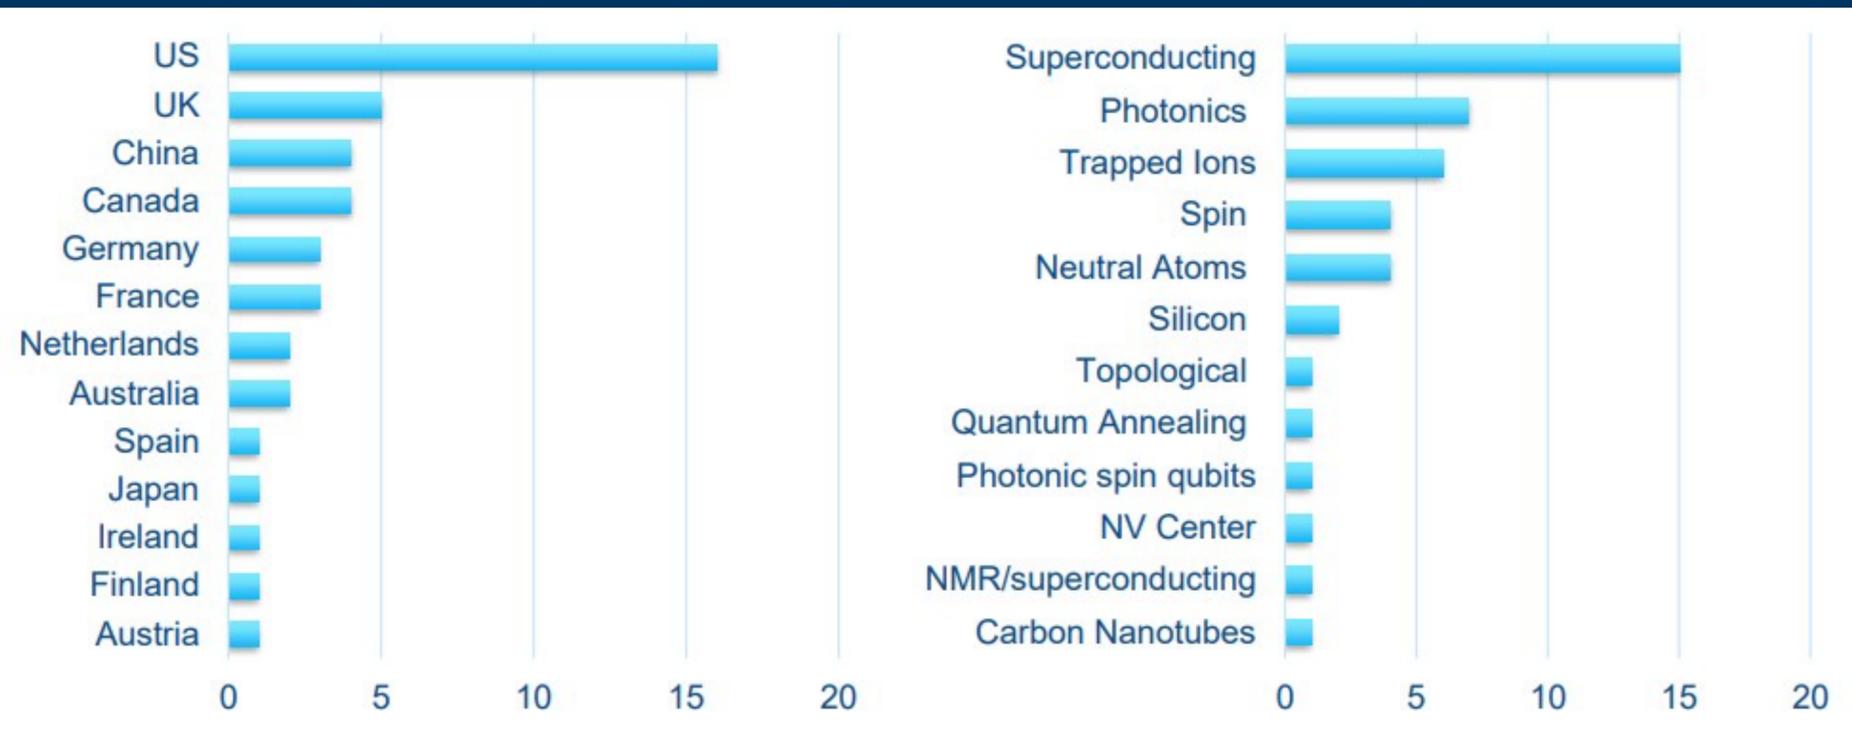

Sources: Literature search; BCG analysis.

¹The data in this exhibit represents public announcements made after 2013; investments may be made for different time horizons.

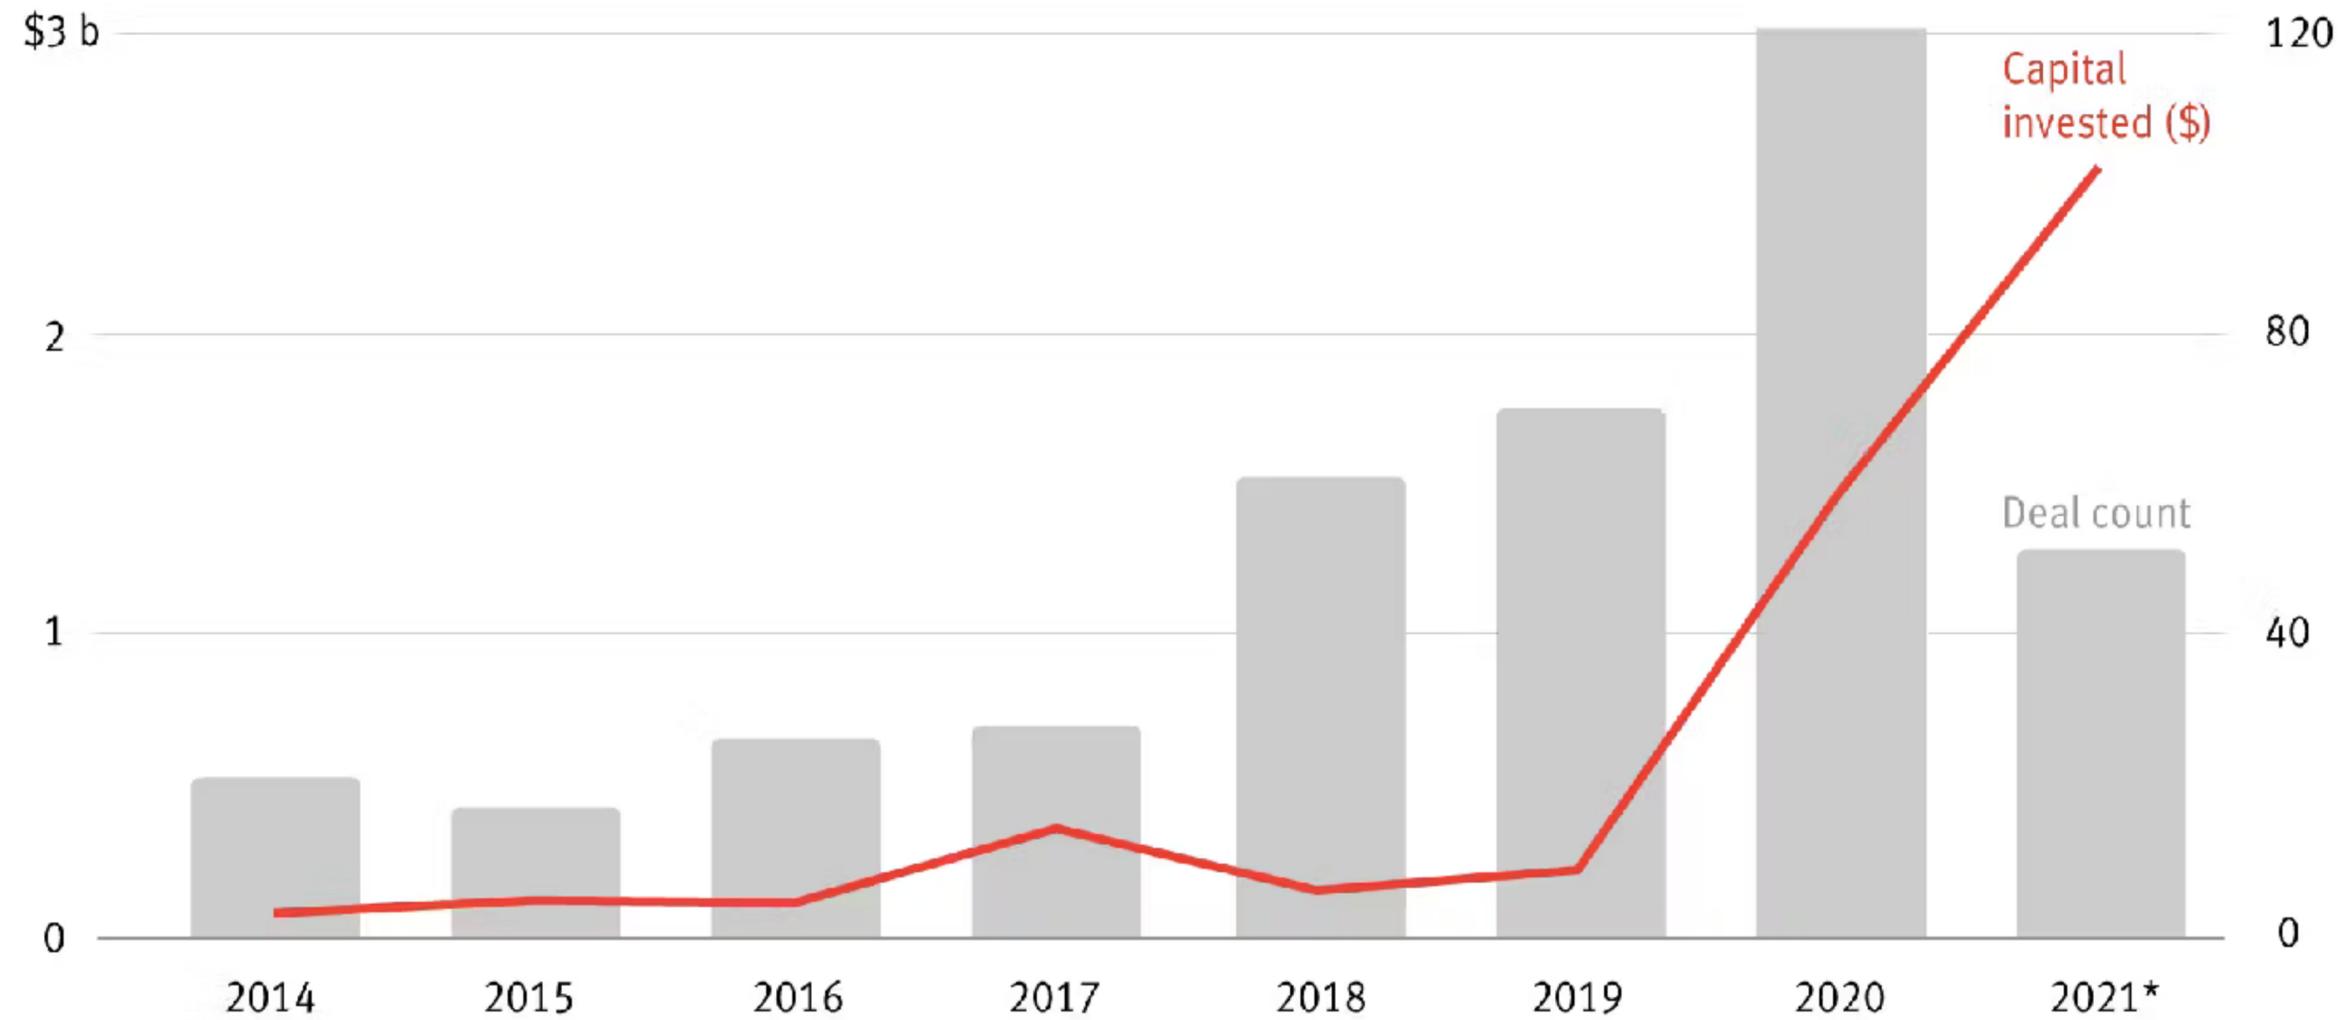

²Investments made centrally by the EU (~\$1.1 billion) as well as those made by Germany, France, the Netherlands, and Finland.

³Public investment figures for China are non-official estimations based on experts and media sources.

Quantum Leap

Capital invested in quantum computing companies

Note: *Figures are year to date

Source: PitchBook

Snake Oil...

No general proof

That a quantum computer must

Be faster than a digital

In all situations

Believe it or not...

But...

Shor's factoring algorithm

Breaks a number into prime factors

$$84 = \boxed{2} \times \boxed{42}$$

Prime Not prime...

$$84 = \boxed{2 \times 2 \times 3 \times 7}$$

All prime...

I thought your idea
to use my idea was
a great idea.

your  cards
someecards.com

But...

N=13506641086599522334960321627880596993888147560566702752448514385152651060

927563

2.2 GHz Athlon 64 CPU PC with ≤ 2 GB memory

2 years...

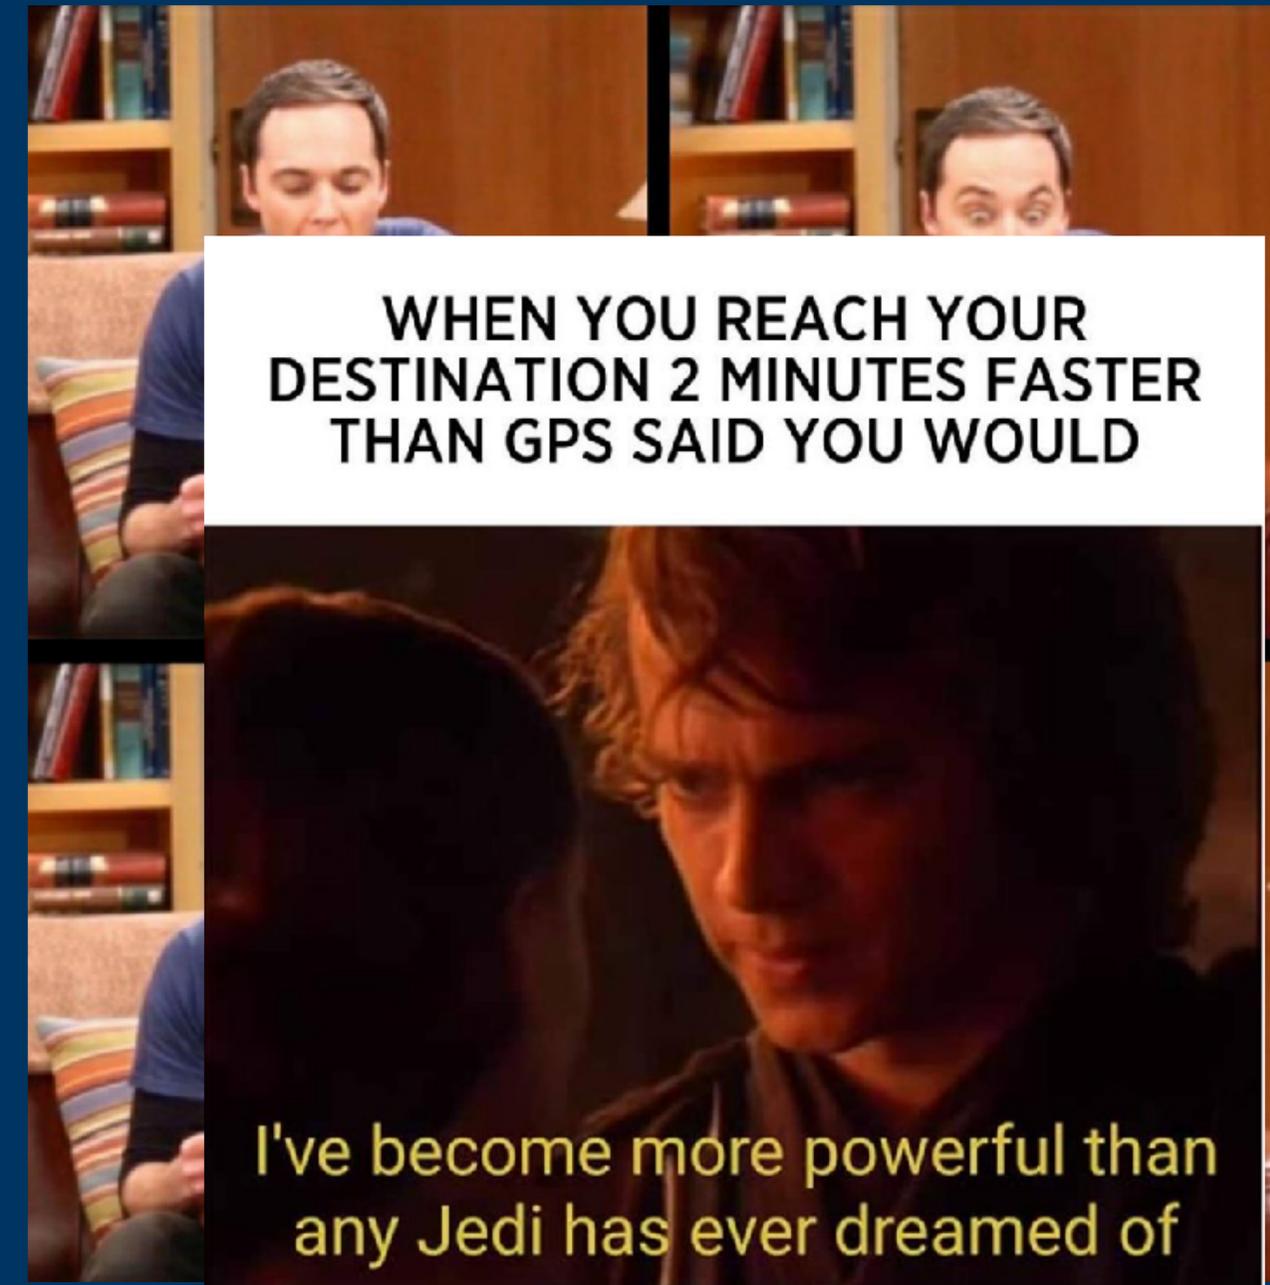

Why does it matter???

Factoring large numbers:

The key to cracking RSA and other encryption...

Shor's factoring algorithm

Exponentially faster than a digital computer

But...

2001 - IBM team

7 qubit device

Nuclear magnetic resonance

Successfully factored....

$$15 = 3 \times 5$$

Best so far, fully using the algorithm

$$21 = 3 \times 7$$

But...

Qubit has to be screened from the environment

That decoherence again...

So:

Let the engineers play

Can do some physics with what they create

Study shielded quantum systems

Also:

Exposes more people to the nature of quantum reality...

**WHEN YOU SEEK TO UNDERSTAND THE NATURE OF REALITY BUT SOME
QUESTIONS LIE OUTSIDE THE SCOPE OF QUANTITATIVE EMPIRICAL INVESTIGATION**
